Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation is charged in the next following gage measurement.

‖ Separate dates of rain not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi. § Lone Oak.

Daily Temperatures for July, 1934.

VOL. XXXIX LOUISVILLE, KY., AUGUST, 1934 No. 8

GENERAL SUMMARY.

Good rains in most northern counties in the first and second weeks relieved the drought that had prevailed in much of that area. During the next two weeks heavy rains occurred in the southeastern and south-central counties, largely in a region that had remained relatively moist. Pastures were partly restored in northern sections and soon developed vigorous or luxuriant growth in most southern districts. A limited area in the extreme northern bluegrass, near the mouth of the Licking, received sufficient rain to start the late crops, but not enough to restore pastures or replenish the water supply.

Where corn had made normal progress the rains brought it forward to maturity, but in the drier districts of the northern and extreme western counties they came too late for early plantings. They were also of doubtful benefit to some early tobacco, which was already badly fired and in condition to lose in the bottom leaves what it would gain by new growth in the top of the plant. For most tobacco the rains came in time to complete its development; while in the hilly sections, where most of the crop was late, this moisture became the basis of the main growth. Tobacco cutting began to an appreciable extent in the burley district about the middle of the month. Showery and humid conditions in the third week delayed curing and caused some farmers to prepare for heating their barns. This situation improved in the last week.

Third crop alfalfa made strong growth after the rains. Cowpeas and soybeans produced such heavy foliage as to require lengthy curing. Late potatoes that had been planted during the hot weather rotted in the ground, causing poor stands or complete failure. Tomatoes made a heavy growth of vine but did not fruit properly. The heavy rains caused splitting and defective growth. In those districts that had suffered most from drought corn cutting began late in the month. In corn that tasseled during the extreme heat it was found that many ears were only scantily filled with grain.

TEMPERATURE.

Weather somewhat warmer than normal, with maxima frequently above 90°, prevailed in the first two decades. Subnormal temperatures thereafter retarded growth and brought the first cool nights of the summer. The extremes were 104° at Franklin on the 11th and 46° at Quicksand on the 30th.

PRECIPITATION.

Precipitation averaged considerably above normal. From the eastern edge of the bluegrass across the mountain region it was far above the average, ranging from 6.0 to 10.0 inches. A few limited areas in the central and western counties received 6.0 inches or more. In the central bluegrass region and a considerable district north of Green River amounts ranged between 3.0 and 4.0 inches. A small area in and adjacent to the lower Licking Valley reported less than 2.0 inches. The range for the State was between 1.61 inches at Cold Spring, Campbell County and 10.84 inches at Pikeville. Heavy rains occurred in most districts in the periods 1st-4th, 10-12th, 14-17th, and 23d-25th. Light to moderate showers were interspersed between these periods. Except for a few days near the close, measureable precipitation was reported on every day. Days with thunderstorms were: 1, 2, 5, 7, 8, 10, 11, 12, 13, 17, 19, 22, 23, 24, 28.

MISCELLANEOUS.

Aug. 10.—A rainstorm of unusual intensity in the counties of Bath, Carter, Lawrence, and Rowan, with its center on Tygarts creek, caused damage estimated at $25,000. Olive Hill was almost completely flooded. Two lives were drowned on Williams creek, a branch of which their home was washed away. Along many creeks the crops were destroyed, the land was scoured and the land disastrously eroded. Road No. 60 and the Chesapeake and Ohio Railway were closed to traffic during most of the day.

Aug. 14.—A rainstorm near Prestonburg caused damage by flooding along creeks estimated at $25,000.

Aug. 19.—An earthquake shock, said to be the most severe experienced, occurred in the region of Cairo, Ill., and was felt southward to New Madrid, Mo.

Floods.—Numerous floods occurred in creeks in eastern counties from the 10th to 14th, caused by excessive local rains. The run-off increased stages momentarily in the Ohio in the periods 11-13th and 17-20th.

ERRATA.

May, 1934: Page 18, Danville minimum temperature should be 36 on 1st, June, 1934: Page 22, Irvington, greatest 24-hour precipitation should be .62, Henderson, prevailing direction should be west.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Rhoesy, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, †, ‖, appearing in the table indicate number of days missing; for example, b represents two days, etc

a Absent other dates. b Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

c Absent other dates. ‖ Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Post office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky. Oneonta, California, Ky.

Daily Precipitation for August, 1934.

VOL. XXXIX LOUISVILLE, KY., SEPTEMBER, 1934 No. 9

GENERAL SUMMARY.

Heavy rain early in the month in the extreme northern counties and moderate rain later on in the central and eastern districts benefited pastures and aided fall plowing. Prior to these rains pastures had been inclined to dry, but in the last half of the month they improved slowly. In western districts the rainfall was so heavy as to seriously interfere with all farm activities. Corn and tobacco cutting were delayed, and plowing was possible only in brief intervals during the last three weeks. Plowing in the central and eastern counties, especially on hills and slopes, proceeded with some difficulty on account of dry soil until the heavy rains near the end, which reached all sections and brought satisfactory conditions for seeding.

Low temperatures, abnormal cloudiness, and the frequency of showers delayed the curing of tobacco and caused some sweating. This weather induced more general interest in the heating of barns during the period of drying. The prevailing weather was very unfavorable for making late hay from soybeans, cowpeas, and alfalfa, which had developed heavy foliage and were slow to cure. Much damage resulted, particularly in the western counties, from imperfect drying and from rain on partly cured cuttings.

The cool weather retarded the growth and ripening of late corn and tobacco. As a rule, however, both crops matured in good time. A negligible amount of late tobacco remained out in the hilly districts at the end of the month. The dampness prevented the prompt drying of corn in shock and caused considerable molding. Late potatoes entered the month with poor stands and feeble growth. They improved somewhat but remained generally poor at the end. For seeding to cover crops, which was unusually extensive, the weather continued mainly favorable.

TEMPERATURE.

Persistent cloudiness and frequent rain in the western counties depressed maximum and average temperatures considerably below normal. In the eastern counties, however, more sunshine and much less rain resulted in temperatures above the seasonal average. The extremes were 95° at Danville on the 6th and at Franklin on the 25th, and 39° at Taylorsville on the 26th.

PRECIPITATION.

Except in a limited district in the Salt River Valley and a few counties along the eastern border, where 2.0 to 3.5 inches occurred, the rainfall largely exceeded the normal throughout the State. In the Purchase and bordering counties east and it ranged from 6.0 to 10.6 inches. East of this section districts received from 4.0 to 5.5 inches. The range for the State was between 1.79 inches at Whitesburg and 10.99 inches at Lone Oak near Paducah. Showers occurred in the period 2d-7th, 7-8th, 11-17th, and 22-23d. The rains of the 11-14th were heavy to excessive locally in the western counties. Moderate to heavy rains occurred generally from the 26th to 29th. There were only a few days on which measurable precipitation was not reported. Days with thunderstorms were: 6, 10, 11, 12, 13, 14, 15, 16, 21, 26.

MISCELLANEOUS.

September 8. Heavy hail, which accumulated to a depth of three inches, damaged tobacco and watermelons in a small area near Hopkinsville.

Rivers;---The heavy rains at the end of the month flushed headwater streams, but caused only a slight rise in the Ohio. Pool stages prevailed during most of the month.

All temperature data are taken from self-registering thermometers.

Only stations having records from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in the respective section or division means.

[1] Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, "a", "b", appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries. ‡ Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

Observers' addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Operator, California, Ky.

Excess as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

|| Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. *Precipitation included in the next following measurement.

2Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

VOL. XXXIX LOUISVILLE, KY., OCTOBER, 1931 No. 10

GENERAL SUMMARY.

Dry weather during the first half favored all farm activities, especially in the western counties, where too much rain late in the preceding month had interfered with preparations for seeding. The remnant of the tobacco still out in the hilly districts was cut and housed in good condition. The high temperature of the second week and in the decade following the middle of the month provided weather unusually satisfactory for curing this late tobacco. During this fine weather considerable late hay was cut and cured. In the extreme western counties some fifth crop alfalfa was harvested. Late potatoes continued to grow until the 29th, when heavy to killing frosts in the northern districts checked their progress. The showers of the last half were helpful to this crop but not sufficient for its needs on the central and eastern uplands.

Pastures improved somewhat in the first decade but deteriorated toward the close because of high temperature and deficient rainfall. Hill pastures dried seriously in the central and eastern sections. They remained fairly good throughout the month in western districts, which had a larger supply of subsoil moisture and received more rain.

Wheat sowing proceeded under favorable conditions until near the middle of the month, after which the ground became too dry in places. As a rule the soil contained sufficient moisture to bring up the seed, and the showers of the last half generally supported growth. In the drier sections growth was hardly as rapid or complete as desirable. The moisture received remained near the surface and was readily lost under the influence of the sunshine and high temperature.

Shocked corn dried out and gathering commenced generally. The work revealed that considerable damage had occurred from molding during the dampness of the preceding month. The weather favored threshing of lespedeza and baling of hay, but was generally too dry for handling tobacco.

TEMPERATURE.

Except for brief intervals at the beginning, middle and end of the month, temperatures above normal prevailed. The weather was especially warm in the periods 4–11th and 20–26th. It was unseasonably cold from the 28th to 30th, when minima of 25° to 30° were registered generally over the State. A maximum of 88° occurred at Henderson on the 11th, Fowling Green on the 21st, and Murray on the 25th. A minimum of 22° was reported from Farmers and Middlesboro on the 29th.

PRECIPITATION.

The rainfall averaged about one-third of the normal amount. In the northeastern counties and a broad belt extending southwest through the center of the State it ranged from 0.25 to 1.00 inch. Westward and southward from this dry section most stations reported from 1.00 to 2.00 inches. Light to heavy rains occurred rather generally on the 18th, and there were showers at most stations on the 26th. A few western and southern stations received moderate to heavy rainfall on the 31st. Scattered showers occurred on the 1st, 6th, 10th, 21st and 29th. The range for the State was between 0.02 inch at Grant, Boone County and 3.36 inches at Middlesboro. Days with thunderstorms were: 17, 20, 24, and 31.

MISCELLANEOUS.

October 31.—Severe windstorms caused damage estimated at $350,000 in the counties of Hart, Green, Taylor, Casey, Pulaski, Rockcastle and Laurel. In Casey County the storm path was one-fourth to one mile in width and 18 to 20 miles long, with the characteristics of a tornado. One person was killed and 24 injured, while 125 buildings were damaged or destroyed. Hail stones measuring 2 1/2 inches in diameter were reported. There was some evidence of tornadic activity in Taylor County. Five persons were killed to death in the ruins of their home in Laurel County.

Damage to auto tops and roofs by heavy hail was estimated at $10,000.

Rivers.—All main streams continued low. Floods along creeks, caused by the storm in Casey and Taylor counties, caused damage estimated at $10,000.

VOL. XXXIX LOUISVILLE, KY., NOVEMBER, 1934 No. 11

GENERAL SUMMARY.

Temperature conditions favorable for the slow growth of fall grains and pastures predominated, but moisture deficiency in most sections acted as a retarding agency. Moderate to heavy showers early in the month served to carry fall growth through the dry period that extended past the middle. Plants remained undersized and growth had almost ceased when additional showers late in the month brought considerable improvement. Unseasonably high temperature in the last decade stimulated progress, but caused rapid loss of the limited moisture supply, which was confined to the surface layers of soil. Although not as large as desirable, fall grains were generally sturdy, deeply rooted, and fairly promising at the close of the month.

Pastures were failing as the month opened, especially on the upland and hilly sections of the central and eastern counties. Except in the western counties, where heavy rains in the third decade caused renewed growth, they deteriorated and became very short. Rye pasture did not make the progress anticipated. Water supplies for livestock failed extensively in the central and eastern sections. These had not been fully replenished when the month closed. Ground water showed unusual depletion, as evidenced by the failure of springs and wells heretofore dependable.

The dry weather largely prevented the handling of tobacco, so that a relatively small amount was made ready for market. On many farms the first stripping occurred during the showery weather of the last week. The weather was exceptionally favorable for corn gathering and other outdoor work. Nearly all corn had been cribbed by the close. Gathering brought to light unusual damage by ear worms; also a large proportion of light and chaffy ears with scattered grains, caused by failure of fertilization during the period of extreme summer heat. Corn dried out thoroughly and was cribbed in excellent condition. Although the mild weather permitted animals to run on pasture throughout the month, the lack of grazing made rather heavy feeding necessary.

TEMPERATURE.

Long periods of decidedly warm weather alternated with short intervals of moderate temperature deficiency. Except for a few days, unseasonably warm weather prevailed during the last half of the month, with daily averages 10° to 20° above normal and maxima reaching 80° at some stations. The extremes were 84° on the 1st at Murray and 14° on the 14th at Farmers.

PRECIPITATION.

Precipitation averaged somewhat less than normal, but the average was raised considerably by the excessive rains in the extreme western counties, therefore most of the State received much less than the seasonal amount. From 2.5 to 3.5 inches occurred in most districts in the southern and central counties east of the lower Cumberland, and 1.0 to 2.5 inches in the counties north of that section. Fifteen to twenty counties in the northern and eastern divisions received from 1.0 to 2.0 inches. In the Purchase and the bordering counties eastward amounts varied between 4.0 and 9.0 inches. For the State the range was between 0.90 inch at Carrollton and 9.01 inches at Paducah. Showers, usually light to moderate but heavy in some localities, occurred generally on the 1st and 4th. In the period 21st–22d the rainfall was generally light to moderate in the central and eastern counties, but heavy to excessive in the extreme western section. Light showers occurred generally from the 26th to 30th. Snow flurries were reported from a few stations on the 11th. Days with thunderstorms were 19, 21, 27, 29.

MISCELLANEOUS.

Rivers.—Small streams were flooded in the Purchase on the 2d and 4th; lower Ohio was slightly affected, otherwise stages continued low during the month.

Errata.—September, 1934: Princeton, precipitation, pages 34 and 85 should be 7.30.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. Hima ay, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, 9 represents two days, etc.
† Also on other dates. ‡ Received too late to be included in means and summaries. ‖ Precipitation is less than 0.01 inch rain or melted snow. § Lone Oak.
¶ Post-office addresses. – Locks 3, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 7, Nicholasville, Ky.; Lock 10, Red House, Ky.; South Independence, Ky.
Oneonta, California, Ky.

Except as otherwise indicated observations are generally made at the afternoon, near sunset, and 24-hour precipitation recorded is for the 24 hours ending at close of observation.

Reference mark (**) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. *Precipitation included in the next following measurement.

†Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage given in which station is located as indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland Tennessee; (O) Ohio; (M) Mississippi.

Live Oak

Daily Temperatures for November, 1934.

VOL. XXXIX LOUISVILLE, KY., [illegible]

GENERAL SUMMARY.

The sharp decline in temperature during the first decade stopped the slow growth that had prevailed in fall grains until early in the month. Light snow cover toward the end of this cold period, which culminated with abnormally low temperatures, was beneficial as protection and later furnished needed moisture. Because of the relative dryness of the soil, the hard freezes had no ill effects on grains. They continued undersized, but remained in good condition at the end of the month. Although pastures had become unproductive because of deficient moisture as well as falling temperature, livestock ranging the fields still obtained some forage that reduced feeding requirements. With the passage from comparative mildness to severe weather stock had to be protected and more heavily fed. Moderate weather prevailed during the last half, but temperatures were too low for growth.

Comparatively heavy precipitation occurred in the western counties, where the subsoil became well supplied. It was generally deficient in the central and eastern counties, where it came in the form of light to moderate rainfall that increased the surface moisture but did not penetrate deeply. These rains toward the end of the month improved the water supply for livestock, which had remained limited in many eastern upland districts. The brevity and infrequency of showers during the first half seriously handicapped the stripping of Burley tobacco and almost prevented any activity in handling the dark variety. Toward the end more frequent rains, with extended moistness, conditioned tobacco for short periods and permitted better progress; but the work could not make seasonal advancement.

Farmers took advantage of the dry weather to do some plowing, but it was noted that dry soil was often turned up. The weather favored the completion of corn gathering.

TEMPERATURE.

Temperatures not far from the seasonal average prevailed during the first week, but in the second they fell as low as 5° to 10° above zero at many northern stations and ranged from 10° to 20° below normal in all sections. Temperatures near or above normal predominated during the last half of the month, with maxima of 60° to 65° at several eastern stations. The extremes were 69° at Middlesboro on the 1st and 5° at Anchorage on the 12th.

PRECIPITATION.

Precipitation averaged slightly more than half the normal amount. From a range of 3.0 to 4.0 inches in the extreme western counties it decreased to 1.5 inches in the Big Sandy Valley. Most of the eastern division received only one-third to one-half of the seasonal average. Fairly well distributed rains occurred in the periods, 2d, 19th, 22d, 24-26th, and 28th-31st. These rains were heavy at some western stations on the 19th and locally in all divisions on the 26th. Snow occurred generally in the period 7-11th. It ranged from trace Harrisburg to 1.0 inch in the western counties and from 2.0 to 6.0 inches in the eastern districts. Precipitation for the state varied between 1.22 inches at Lovelaceville, Ballard County and 6.8[illegible] Whitesburg, Letcher County. Thunderstorms were reported on the 3d, 24th, and 25th.

MISCELLANEOUS.

Rivers.—A rise in the upper Ohio during the first week brought moderate stages to that section and raised the river well above pool levels in the middle and lower sections. It soon subsided and remained near pool stages during the last half of the month.

State averages and extremes				37.0	− 0.9	69	1	5	12	46	2.18	−1.80	1.62	1.5	9	10	6	15	s.	

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries.

¶Post-office addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky; Lock 10, Red House Ky; Scott, Independence, Ky. Oneonta, California, Ky.

Daily Precipitation for December, 1934.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. • Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Long Oak

Daily Temperatures for December, 1934.

VOL. XXXIX LOUISVILLE, KY., ANNUAL, 1934 No. 13

GENERAL SUMMARY.

The dryness of January, February, April and May resulted in a serious deficiency of subsoil moisture at the beginning of the growing season. The total precipitation for these months averaged about one-half the normal amount, but some northwestern counties received little more than one-fourth of the seasonal moisture. Good rains in March temporarily relieved the winter shortage in most of the State. In many northern sections, however, these rains are much less than normal and insufficient to break the winter drought. The low water content of the subsoil thus became an important factor in reducing the growth of pastures and grains, and in bringing about more complete dependence of crops on the surface moisture obtained from summer showers. Also, on account of this condition more current rainfall than usual was needed to make the crops. Heavy rains in June largely relieved the situation, but left districts of considerable size in the central and eastern sections without sufficient moisture. Likewise the good rains of July were not general but left about one-third of the State too dry, with crops suffering. The intense heat late in this month caused heavy damage to tasseling corn and enlarged the areas in which pastures and crops are deteriorating. The rains of August reached most dry districts and brought general relief to a critical situation. Pastures revived in all sections, and where the July rains had been heavy they were completely restored. Generous rainfall in September matured the crops and maintained pastures.

The dry May weather limited tobacco setting to machine work, and it was not until the second week in June that the rainfall made possible transplanting in the hilly districts. Favorable weather in October permitted this late tobacco to mature. The showery, cool September interfered seriously with cutting and curing tobacco, and caused molding of corn in shock. Although the month was very dry, soil moisture in October remained sufficient to bring up fall grains. Light showers from time to time maintained slow growth, which continued through November because of favorable temperatures, and finally brought the undersized plants to fair condition for entering the winter. The dry October and November weather favored corn gathering, but prevented much progress in preparing tobacco for market.

The Weather By Months.

JANUARY.---Unseasonable warmth, followed by severe cold late in the month, caused extensive damage to fruit. The dry weather and mild temperature favored plowing and other outdoor work. Light showers furnished enough moisture to permit handling of tobacco.

FEBRUARY.---The dry, cold, and inclement weather seriously hindered tobacco marketing. Plowing advanced to completion on many farms, with fallow land working equally as well as sod. Water for livestock had to be hauled in some northern and eastern counties.

MARCH.---Rain, sleet or snow at frequent intervals, with low temperature, prevented most progress outdoors. Grains and pastures made a very slow start. Excessive rains caused high water floods in the southeastern counties.

APRIL.---Abnormal warmth early in the month started vegetation, but cool weather later retarded growth and discouraged corn planting. Generous sunshine, strong winds and low humidity rapidly extracted the soil moisture. Tobacco plants and gardens were delayed.

MAY.---Soil moisture diminished rapidly under the influence of high temperature, but corn planted in well prepared land came up to a good stand. Grains, pasture and forage crops on thin soils and uplands began to suffer. Tobacco plants were grown largely by artificial watering. Hauling of water increased in the central and eastern counties.

JUNE.---Near drought conditions were broken by rain on the 10th after which crops made good progress. Wheat and barley headed short and failed to fill completely. High temperature and rapid evaporation prevented the maximum benefit from the early generous but irregular rainfall.

JULY.---With some areas too wet from repeated showers and others much too dry, there was extraordinary unevenness in crop development. Drought became severe in a few extreme northern counties. Tomatoes failed to set because of the excessive heat.

AUGUST.---The rains came in time to complete the growth of corn in most districts and save corn. Forage crops made a heavy growth, which was cured with difficulty during the showery weather. Late potatoes planted during the hot weather failed to germinate.

SEPTEMBER.---In western districts heavy rains interfered with all farm work. Only one short period was favorable for curing late hay. The growth and ripening of late corn and tobacco were retarded by cool weather.

OCTOBER.---Considerable late hay was cut and cured during the fine weather. Hill and upland pastures deteriorated rapidly for want of rain. Dry soil late in the month affected wheat sowing.

NOVEMBER.---Water supplies for livestock failed in many central and eastern sections. The failure of dependable well and spring supplies is unprecedented for so much water.

DECEMBER.---Low temperatures early in the month retained grains in dormancy. The lack of ground water continued in central and eastern sections. Dry weather delayed the handling of tobacco.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE.—Tables and charts giving climatic data for Kentucky in detail during 1933 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in Charge at that office. For indexes to special articles published during past years see Kentucky climatological reports which can be found in the Monthly Report for June, 1933.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XL. LOUISVILLE, KY., JANUARY, 1935 No. 1

GENERAL SUMMARY.

The mild weather that prevailed during the first three weeks started grass and winter grains into slow growth, and caused anxiety on the part of orchardists in regard to the condition of fruit buds. Spring-like temperatures occurred continuously in periods of considerable length. Swollen buds appeared on various early blooming trees and shrubs. This warm spell was followed by a week of rather severe weather, in which minimum temperatures fell to zero at many stations and were near zero generally over the State.

Except for moderate to heavy rains in the southeastern counties, the weather continued dry through the first half of the month. Tobacco stripping and marketing were much delayed by this dry weather. Surface moisture remained sufficient for the needs of grains, but the plow often turned up dry soil. Heavy rains generally over the State in the third week finally soaked the ground for a considerable depth and replenished water supplies in the central and eastern upland and hilly sections. Until these rains the hauling of water had continued in many localities in those districts. This period of rain ended with light to moderate snow, which preceded the cold wave and gave winter grains some protection from the severe freeze. Because of the dry subsoil the moisture passed rapidly downward, leaving the surface layers without much surplus water; hence the freezes had no marked injurious effect on grains. In most of the State the badly needed moisture was generally absorbed, but in some southern and eastern localities there was sufficient run-off to raise streams. This was the first period of any length during the winter when all types of tobacco were brought into satisfactory condition for stripping. Except for a few cold days in the third week, the weather was unusually favorable for live-stock, poultry, and milk production.

TEMPERATURE.

In the periods 6-10th and 16th-21st daily departures ranged from 10° to 25° above normal, and maxima of 60° to 76° were registered at all stations. After the 21st temperatures continued low, with the coldest weather in the period 22d-24th, when minima ranged from zero to 5° in nearly all sections. The extremes were 71° at Quicksand and Williamsburg on the 7th, and −2° at Berea and Greensburg on the 24th.

PRECIPITATION.

Precipitation averaged considerably above normal, but there were great variations in the amounts that fell in the northern and southern counties. In the section from the Purchase eastward nearly to the Big Sandy, it ranged from 4.0 to 7.0 inches in most districts, while several southern counties received as much as 8.0 inches. Northward amounts declined rapidly to about 3.5 inches in a narrow strip along the Ohio, in a part of this section near the mouth of the Kentucky River less than 3.0 inches occurred. Except in the counties adjacent to the river, amounts were generally equal to or above the average for the month. Light to moderate rains occurred on the 1st and in the period 7-10th. The precipitation was moderate to heavy from the 15th to 17th and moderate to excessive from the 19th to 22d. A considerable part of it on the 21st and 22d fell as snow, which ranged from 1.0 to 4.0 inches in most localities and from 5.0 to 8.0 inches in some south-central and eastern counties. For the State precipitation varied between 2.79 inches at Carrollton and 9.92 inches at Bowling Green.

MISCELLANEOUS.

Rivers:—Run-off from the heavy rains of the 19th-21st caused a sharp rise in all streams of the State. This augmented a rise that began in the upper Ohio on the 18th, and caused crest stages 10 to 15 feet below flood heights in the upper and middle sections of the stream on the 26th and 27th. Flood stages were reached in the Evansville district on the 26th, and the river continued near or slightly above flood until the 29th.

State averages and extremes				37.8	+ 1.4	71	7	− 2	21	50										

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in computing section or division means.

Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Inconspicuous letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡ Precipitation is less than 0.01 inch rain or melted snow.

§ Lone Oak.

* Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 14, Red House Ky.; Oneonta, California Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak

Daily Temperatures for January, 1935.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

J. L. KENDALL.

VOL. XL LOUISVILLE, KY., FEBRUARY, 1935 No. 2

GENERAL SUMMARY.

Except for a few cold days, mild weather prevailed during the month. Decidedly warm weather in periods of several days near the middle and also in the last week caused grass and winter grains to renew their growth. Buds expanded and some shrubs began to put out leaves. These premature developments were checked by the cold wave near the end. Day temperatures considerably above freezing and night temperature frequently below caused some heaving of soil on lands inclined to hold water. However, the light precipitation and the tendency of surplus moisture to seek the subsoil relieved the surface of saturation so that the freezes usually had little or no lifting effect, hence injury from this cause was negligible. Winter grains were smaller than usual in size, but appeared to be well rooted and in good condition.

Although light in quantity, the frequency and duration of precipitation, together with the relatively warm weather, favored the conditioning and handling of tobacco. Stripping and marketing were practically finished in the burley district, and proceeded rapidly toward completion in the dark area. Because of the delay due to dryness in the first half of the winter, this favorable weather was of marked assistance to the tobacco industry.

Some plowing occurred in the first and last weeks, mainly in the northern and western counties. As a rule the soil remained too wet in the southern sections which received the heavy rains of the preceding month. In the last decade the surface soil on well drained uplands dried out sufficiently that preparation for tobacco plantbeds and early gardens could be commenced. The cold spell near the end caused the suspension of these activities. The water supply in the soil is generally good in central and southern districts, but there is still complaint from some northern counties of relative dryness in the deeper layers. The weather was more favorable than usual for spring lambs.

TEMPERATURE.

Temperatures averaged much above normal in the periods 1st-5th, 8-9th, 12-15th, and 21st-22d. From the 13th to 15th the daily excess ranged from 10° to 22°. Departures as far below the average occurred on the three cold days at the end of the month. The extremes were 73° on the 9th at Mayfield and 5° on the 26th at Mubank.

PRECIPITATION.

Because of marked deficiency in the northern counties, precipitation averaged about an inch less than normal. In most southeastern counties it ranged from 3.0 to 4.0 inches, which is not far from the seasonal amount. In a broad belt through the State from the southern Purchase to the lower Big Sandy precipitation varied between 2.0 and 3.0 inches. North of this section it shaded off to about one inch in the counties along the Ohio between the Green and Licking. This area of light rainfall coincided rather closely with the district receiving the least moisture in the preceding month. With the exception of January the precipitation has been much less than normal in the northern half of the State for the past five months. Moderate to heavy rain occurred in the central and southern counties and light to moderate rain in northern districts in the periods 8-10th, 13-15th, 23d, and 25-27th. Snow, ranging from flurries to 1.0 inch, was reported on the 16th, 17th and 26th. For the State precipitation varied between 0.53 inch at Anchorage and 4.23 inches at Jenkins.

MISCELLANEOUS.

Rivers:—The rains of the 13-15th, falling on the wet soil of the southern counties, caused enough run-off to start a moderate rise in the Ohio. The rains later on maintained these moderate stages until the end of the month.

State averages and extremes																				

Temperature data are taken from self-registering thermometers.

Precipitation data are taken from automatic rain gauges.

Precipitation and temperature data are computed only for such stations as have ten or more years of record, but all complete reports are published. Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River, used in this publication or in division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries. ‡ Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶ Postoffice abbreviations: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Oneonta, California, Ky.

Daily Precipitation for February, 1935.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(), Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Long Oak.

Daily Temperatures for February, 1935.

VOL. XL. LOUISVILLE, KY., MARCH, 1935 NO. 3

GENERAL SUMMARY.

The abnormally warm weather that prevailed during the month caused vigorous growth to start unusually early and to continue steadily. Pastures on the warmer soils soon reached grazing condition. Although winter grains started rather small, in many instances they grew so rank as to make pasturing advisable to prevent early jointing. Clover and alfalfa advanced rapidly and seemed to be in almost perfect condition. Peaches, pears, plums and cherries began to bloom in the western counties near the middle of the month. In the decade of high temperature that followed they bloomed on the northern and eastern uplands. The prospect for fruit presented by the blossoming trees was exceptionally fine, but the premature development rendered them especially vulnerable to possible late freezes.

During the dry and warm weather of the first decade practically all of the remaining tobacco plantbeds were sown. In the southern counties plants began to come up in the third week, and were coming up generally toward the end. Plowing, seeding, and early garden preparations moved forward rapidly until the heavy rains of the 10th, which were the first to stop such work for any considerable length of time. These rains were also the first to penetrate deeply into the subsoil of the northern counties, and were therefore of the greatest possible value in providing a reservoir of summer moisture. After this frequent rains almost entirely prevented working the soil. Some potatoes were planted early in the month, and near the middle, but most of this work remained uncompleted at the end. Because of the large amount of winter plowing, the interference with that work was not serious. The long moist period favored the completion of delayed tobacco stripping and marketing. At the close of the month vegetation seemed to be from ten days to two weeks ahead of its average seasonal condition.

TEMPERATURE.

In the first week and the last decade temperatures averaged from 8° to 25° above normal on most days. The average daily excess at the various stations was 7° to 10°. Only a few days were colder than normal. Maxima above 80° were registered frequently in the warm periods, while minima above freezing were the rule in the last half of the month. Extremes of 86° at Princeton and 20° at Quicksand were reported.

PRECIPITATION.

Precipitation averaged more than twice the normal amount. In the extreme northern counties from Jefferson eastward it ranged from 5.0 to 7.0 inches. There was a fairly regular increase southward to 11.0 inches or more near the boundary. Westward it increased to 13.0 inches in the valley of the lower Green, and to more than 14 inches in a limited area east of the lower Cumberland. Most of the western division received about three times the average March precipitation. Light to moderate showers occurred from the 5th to 7th. There were heavy to excessive rains in all districts in the periods 10-12th and 20th-21st. Many torrential rain-concentrations reported heavy rains from the 20th to 22d. Outward over-flow of creeks and rivers was recorded in some part of the state. Because of the limited accommodations for most of the rainfall and its small distribution in time, a large percentage entered into the ground and subsoil. Total soil, 1-2 ft. state investigation, varied between 4.3 in. in Bracken County and 14.6 inches at Princeton. The snowfall, on 11 days, was only 1.3 inches, in northeastern counties. Days with 0.01 inch or more: 6, 10, 20, 21, 23, 24, 25, 26, 27, 28, 31. The two corrected and flooded Ohio River gauges were:

MISCELLANEOUS.

March 5.—An unusually dense dust storm [illegible] several hours the sun failed to cast shadows through the dust and smoke. The [illegible] and Green were obscured from the spectators.

March 29.—Local floods caused heavy [illegible] damage in the Cumberland Country. One man was [illegible] injured. Severe [illegible] blossoming fruit trees damaged by severe [illegible] conditions.—A man was [illegible] by flying [illegible] near Princeton.

Tornadoes.—The heavy rains of the 10th and 11th [illegible] The cold spell was most extensive and relatively [illegible] western Arkansas, where crests exceeded the flood [illegible] the upper and middle sections of the Ohio [illegible] Wabash [illegible] rise brought flood stages to the lower Ohio from the 20th to the [illegible] crest stages were slightly exceeded in the upper Cumberland and in the Barren, and in the middle and lower Kentucky. The lower Ohio remained above flood stage from the 12th till the end of the month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, ª, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak

¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Oneonta, California, Ky.

Daily Precipitation for March, 1935.

J. L. KENDALL.

VOL. XL LOUISVILLE, KY., APRIL, 1935 No. 4

GENERAL SUMMARY.

Showery weather during the first half of the month kept the ground wet and largely prevented planting and soil preparation. Plowing became possible on the uplands about the end of the third week, when potato planting, gardening, and plowing for corn were resumed. Some oats were sown, but the lateness of the opportunity to sow deterred most farmers from risking this crop. Favorable weather during the last decade permitted most of the delayed planting of potatoes and gardens to be completed. Preparations for corn advanced rapidly and planting on uplands began about the 22nd. Cotton planting commenced near the 24th. Fields plowed in the winter had been so packed by the heavy rains that more than the usual amount of work was necessary in discing or even rebreaking to condition the soil for planting. The floods that covered about 75,000 acres of western bottom land subsided during the third week, but this ground remained too wet to be worked.

Low temperature and lack of sunshine during the first three weeks delayed the growth of tobacco plants, so that the time gained by their excellent start was mostly lost. The sunshine and excess warmth of the last week produced rapid progress and a fairly favorable state of advancement.

Wheat, rye, barley, and bluegrass grew rank on uplands. On the flat and low ground saturation and standing water hindered growth and caused yellowing. The watery condition of grass and the soft turf prevented full use of pastures. The damp cloudy weather favored the starving of young clover and lespedeza, but interfered seriously with seeding these crops. On the eastern uplands plowing revealed less water in the soil than would have been expected from the surface dampness, which would indicate continued rapid descent of moisture into the subsoil.

Severe freezes on the 16th and 17th caused heavy damage to tree fruits in the northeastern counties and considerable damage in central sections. Most fruit in the western and southern districts escaped injury, although strawberries suffered to some extent.

TEMPERATURE.

A short period with temperature near normal at the beginning of the month was followed by two weeks of abnormal cold in which daily means were 5° to 26° below the seasonal average. A few decidedly warm days occurred near the end. Minimum temperatures on the 16th and 17th ranged from 24° in northeastern districts to 32° in the southwestern counties. Maxima near 70° were registered generally on the 26th. The extremes were 92° at Parkstown on the 26th and 24° at Mt. Sterling and Williamstown on the 16th and at Quicksand on the 17th.

PRECIPITATION.

Precipitation averaged somewhat above normal, but a considerable area in the north-central and extreme northern counties received less than the seasonal amount. During the first two decades measurable precipitation was reported every day. Daily showers also occurred on the last four days, leaving only about a week sufficiently free from rain for plowing or planting. In most south-central and southeastern districts the monthly amounts ranged from 5 to 7½ inches, southward they diminished irregularly to about 4½ inches near the Ohio River and to 3.0 inches in the lower Licking Valley. Heavy local rains occurred generally in the period 18th–21st, but other rainfall was light to moderate. Snowfall totaled mere flurries to 1.0 inch, and was entirely [illegible] Eastern counties. Four-day stage predictions to [illegible] Cave Run Reservoir, Campbell County, and 7.14 inches at Cynthiana. Days with [illegible] were: 2, 3, 5, 6, 7, 18, 20, 27, 29.

MISCELLANEOUS.

April 4.—Lightning destroyed a barn near Jamestown, with heavy loss of tobacco and livestock.

George's Creek was above flood stage from Dam 47 to [illegible] on the 1st. It subsided very slowly, and passed below flood stage at Cumberland on the 2nd. The 1st Crest was in flood four days, the 1st until the 2nd. The second crest was [illegible] on the 2nd, 9.7 feet above flood stage. At the time [illegible] had been driven from their homes on the Green River [illegible]. In the vicinity of Calhoun and Rumsey an area of about 30 square miles was [illegible].

Same as crops and other purposes.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are on the Kentucky River; other Locks are on the Green River; other Locks are on the Kentucky River.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow.

† Also on other dates. †† Received too late to be included in means and summaries.

¶ Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Omeuta, California, Ky.

§Lone Oak.

Daily Precipitation for April, 1935.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

( ) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

Exact drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

‡ Lone Oak.

Daily Temperatures for April, 1935.

Vol. XI. LOUISVILLE, KY., MAY, 1935 No. 5

GENERAL SUMMARY.

Frequent moderate to heavy rains interfered seriously with farm work, especially in central, eastern, and northern districts. It became dry enough to plow and plant corn on two or three days in the second week, and again toward the end of the fourth week. Light showers on the last three days retarded but did not stop the work longer than a few hours. Corn planting continued during these brief favorable intervals as rapidly as the land could be made ready. It was well advanced in the bluegrass region when the month ended, but merely a good start had been made in the northern counties. Lighter rains and longer fair periods near the south border and in the southwestern counties permitted cotton and corn planting to proceed with less delay. Corn was up generally in that district, and the cultivation of cotton had commenced at the end of the month. The rise to normal temperature in the last week caused better germination.

Wheat, rye, and barley on flat lands died in spots where water stood or grew in irregular and stunted fashion. Wheat appeared unusually yellow and rusty, even on uplands, with the tendency to grow tall spindling straw and small heads. Sunshine and drier weather in the last decade caused some improvement. Barley harvest began in the southern counties in the last week.

Tobacco plants reached proper size and transplanting began near the middle of the month, but progress was slow because most land remained unprepared. Many plants became too large and yellowed in the beds.

Pastures and forage crops grew rank and weedy. Making first crop alfalfa hay succeeded fairly well in the southwestern counties, but cloudiness and showers interfered in other districts. Early strawberries in western and southern areas were seriously damaged by continued rain at time of ripening. Berries in the northern counties ripened in better weather and were not much injured.

Gardens have rarely been so backward and poor. Only cool weather growths made any progress of consequence. Except for delayed cultivation, potatoes developed fairly well. The month ended with farm work much delayed and seriously congested.

TEMPERATURE.

Except for a few warm days near the beginning, in the second week and near the end, unseasonably cool weather prevailed, with average temperatures 5° to 20° below normal. Minimum temperatures were not unusually low, but persistent cloudiness depressed the maxima. The extremes were 91° at Murray and Williamsburg on the 27th, and 26° at Middlesboro and Pippapass on the 1st.

PRECIPITATION

Precipitation averaged far above normal, and every part of the State received more than the average amount. Most heavy rain occurred in the periods 2d-7th, 10th, 15th-17th and [illegible]

and the south border [illegible]

VOL. XL LOUISVILLE, KY., JUNE, 1935 NO. 6

GENERAL SUMMARY.

Cool rainy weather during the first three weeks, with but little sunshine, was exceptionally unfavorable for farm operations and the growth of crops. Fair progress with plowing and planting occurred in the brief periods of good weather in the first decade; but toward the end of the rainy spell conditions grew so much worse that the soil could not be prepared. The rains culminated in excessive downpours on the 21st, that flooded lowlands, damaged standing and shocked wheat, and made field work impossible for several days. This was followed by a decade of fair weather in which the temperatures rose to normal and crops began to make seasonal growth. Much land in the western counties intended for tobacco could not be made ready, until very late for transplanting. Not all the corn crop could be put out in that section. In the eastern counties lighter rainfall and somewhat longer periods of fair weather permitted better progress. On the well drained uplands most farmers succeeded in getting out the staple crops, although the work had to be done piecemeal and was unduly prolonged. Cultivation of early corn was better in this section, but the crop suffered more or less everywhere. Areas with slow drainage became exceedingly foul with weeds and grass. During the wet three weeks there was practically no weather entirely suitable for haymaking. The heavy growth of alfalfa and the wet ground made curing slow, therefore much hay was lost or put up in unsatisfactory condition.

Wheat developed fairly well on the uplands, but was often drowned out on the flat sections. Harvest proceeded under such difficulties and was so delayed that wheat became too ripe. In this condition the windy rains caused much lodging and falling, with heavy loss in some western sections.

Fair, warm weather in the last decade permitted the completion of harvest and resumption of other delayed farm work. Gardens, potatoes, and other minor crops suffered from weediness and lack of cultivation. Pastures continued luxuriant. The rains caused considerable damage to strawberries.

TEMPERATURE.

A few days with temperature slightly above normal occurred at the beginning, in the middle, and at the end of the month; otherwise abnormally cool weather prevailed. The low daily averages were due mainly to the influence of cloudiness and rain on the maximum temperatures. The extremes were 96° on the 30th at Maysville and 44° on the 9th at Mammoth Cave and on the 10th at Heidelberg.

PRECIPITATION.

With one exception, June, 1928, this was the wettest month of the name on record. In an area two to three counties wide, extending from Ballard east to Rockcastle, the total rainfall ranged between 8.0 and 16.0 inches, with the region of heaviest rain centering about Muhlenberg County. A few counties in the upper Kentucky Basin received 8.0 to 10.0 inches. North of this belt of excessive rainfall amounts diminished irregularly to about 6.0 inches in counties along the middle and upper Ohio. To the south and they fell off to about 4.0 inches in the southwestern and southeastern corners of the State. Moderate to heavy rains occurred in the periods 2d-5th, 7th, and 10th-22d, with excessive downpours on the 3d, 18th, 21st, and 22d. A few stations in the south central and western counties report d from 4. to 1.0 inch of rain on the 21st. For the state amounts averaged between 3.19 inches at Middlesboro and 17.61 inches at Greenville. Days with thunderstorms were: 2, 3, 5, 7, 8, 9, 11, 12, 13, 14, 16, 17, 18, 20, 21, 26, 29, 30.

MISCELLANEOUS.

June 21—Excessive rains flooded homes and business houses in Farlington, Madisonville, Nortonville, Slaughters, and other places in Hopkins and Muhlenberg counties. Damage by wind in Rocke Counties, mainly to barns, was estimated at $50,000. Highways and bridges were damaged by floods in Caldwell County, and destroyed crops in northern Graves County. Near Greenville the Illinois Central trains were stopped by the floods. Near Bar Ford a mother and her three children were drowned in swollen West Fork Creek.

Floods—The Ohio was above flood stage in the Cairo district in the periods 1st-3d, 10-14th, and 26-30th. The rains of the 21st raised Green River and its tributaries above flood stage, and again submerged about 50,000 acres of farm lands, a considerable part of which had been prepared for crops.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark **) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(‖) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

* Lone Oak §10.10.

Daily Temperatures for June, 1935.

VOL. XL LOUISVILLE, KY., JULY, 1935 No. 7

GENERAL SUMMARY.

Except for deficient moisture at times in hilly and upland sections, weather conditions during the month were favorable for all growing crops. The fair weather and relatively high temperature of the first three weeks enabled farmers to finish clearing out the accumulation of weeds. Early corn could not be given the usual amount of plowing, hence it was laid by with some weeds and grass in the rows. In this condition it offered rather poor resistance to the dry weather. Corn that stood too long in the weeds before plowing turned yellow in spots. Toward the end of the dry period there was some firing on warm slopes. Medium and late planted corn and all tobacco were properly cleaned out and cultivated. Hardening and cloddiness of soil, due to the rapid drying of previously super-saturated ground, interfered seriously with the quality and completeness of tillage.

Showers that began in the third week and continued for several days reached most sections with moderate to heavy rainfall and restored ideal growing conditions. By softening the clods and top soil these rains greatly aided cultivation. The cooling of the soil and atmosphere by the showers and cloudiness brought conditions more favorable for planting late potatoes. The rains were helpful but not sufficient in the lower valleys of the Licking and Green, and also in the Purchase.

Grass on hills and warm slopes began to deteriorate during the dry spell, and growth fell off decidedly in all types of pasture. In about half of the State pastures were thoroughly revived, but in most western and some extreme northern counties they need more rain.

The dry weather retarded the growth of tobacco, but after the rains it developed rapidly. Topping of early tobacco became general toward the close, with soil moisture favorable for quick spreading. As a rule there was ample opportunity for haymaking, oats harvest, and threshing during the first three weeks. The lowered quality and yield of grain showed the damaging effect of the wet spring. The weather in the cotton district, which was somewhat warmer and drier than normal, caused that crop to regain most of the time lost because of the unfavorable early season.

TEMPERATURE.

Temperature above normal predominated during the first two weeks and occurred almost daily in the last half. Maxima of 100° were recorded in the western counties where the rainfall was lightest, but temperatures at most stations were considerably lower and relatively moderate for this month. Minimum temperatures on most days were comparatively high. The extremes were 103° at Murray on the 31st, and 55° at Middlesboro on the 15th.

PRECIPITATION.

The rainfall increased irregularly from about 1.0 inch in the the extreme western counties to 8.0 inches or more in eastern districts. In the lower Licking Valley and westward along the Ohio River most sections received from 1.5 to 4.0 inches. A few stations in the Green River Basin reported 5.0 to 7.5 inches. In southeastern border districts, the central bluegrass region, and most northeastern counties from 4.0 to 11+ inches occurred. Amounts in the State ranged between 0.80 inch at Pennyrile and 11.21 inches at Pine Mountain. Nearly all of the rainfall accompanied thunderstorms and was quite irregular in daily as well as seasonal distribution. Daily showers occurred in the periods of 7th and 21-31st. They were heaviest and most frequent on the central and eastern counties. Hearse to 67[illegible] local rains occurred in the central and northeastern bluegrass region and Ohio River Valley in the third week. Days with thunderstorms were: 1, 2, 3, 4, 5, 6, 17, 18, 20, 27, 23, 24, 25, 26, 28, 29, 31.

MISCELLANEOUS.

July 4.—A man was killed by lightning while [illegible] a street at Ashland.

July 5.—A woman was killed by lightning at home [illegible] while standing on her porch. A man was killed by lightning at [illegible] while standing [illegible] Lexington [illegible] water [illegible].

July 31.—A wind storm caused damage to [illegible] tobacco, corn, tobacco, and crops in Jefferson and Oldham counties estimated at [illegible].

Floods.—The lower [illegible] in the Ohio [illegible] rivers [illegible] the beginning of the month and subsided [illegible] were [illegible]. A [illegible] and [illegible] under [illegible] resulted from the [illegible] rains in the last week.

Frosts.—May 1934, page 18: Mean temperature for Middlesboro should be 64.6 and for Williamsburg 66.1.

All temperature data are taken from self-registering thermometers.

For departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining extreme and departure values.

Dispatch, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, 6 represents two days, etc.

* Also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

‡Date of occurrence. ‖Lock 5, Lewisburg, W. Va.; Lock 6, Versailles, Ky.; Lock 9, Nicholasville, Ky.; Lock 10, Red House, Ky.; Oneonta, California, P. C.

* 12-04. ** 13-35.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. *Lone Oak §10.10.

Daily Temperatures for July, 1935.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

J. L. SUNDALL.

VOL. XL. LOUISVILLE, KY., AUGUST, 1935 No. 8

GENERAL SUMMARY.

Abnormally warm weather in the first two weeks, in connection with local moisture shortages, caused marked variation in crop conditions. These were most pronounced in the hilly districts of the central and western counties early in the month, and in the southern counties toward the end. The long period of warm, dry weather permitted threshing to go on almost without interruption until practically completed. A large quantity of excellent hay resulted from this favorable weather. Moderate to heavy showers in all sections in the third week revived pastures and greatly benefited the growing crops. Some early corn in dry localities, mostly west and south, had fired during the dry period and was too far gone to be helped. These rains were timely, however, for the late corn, which had developed large root systems and responded to the abundant moisture with very rapid growth. Most of it had reached the tasseling stage by the end of the month. Several days of abnormally cool weather at the end of the month were unfavorable for this late corn.

The dryness of the first half retarded late tobacco, and some localities west and south became too dry for this crop later in the month. Rapid advancement followed the rains of the third week, and this growth was maintained in the northern counties by the heavy rains of the last week. Much tobacco was topped very late, and in southern districts plants of the latest settings were often small and undeveloped. Some parts of the bluegrass region received too much rain for tobacco as well as other crops, and local downpours caused considerable damage. Cutting commenced in the burley district in the second week, with temperatures rather high but the weather otherwise favorable. The humid weather of the third week and the cold winds of the last few days were unfavorable for housed tobacco. Late potatoes, field tomatoes, gardens, and forage crops improved decidedly during the last half of the month.

TEMPERATURE.

Temperatures above normal prevailed during the first three weeks and below the seasonal average in the last decade. They were 8° to 14° below normal on the last four days, and minima [illegible] or lower at many stations. Maximum temperatures of 100° or higher were registered early in the month at most western and some southern stations. The extremes were 104° at Lovelaceville on the 6th and 35° at Greensburg on the 31st.

PRECIPITATION.

Rainfall increased northeastward from less than 2.0 inches in some western districts to 7.0 inches or more in the bluegrass region. Most sections in the northeastern quarter of the State received from 5.0 to 7.0 inches and in the southeastern mountain districts also about 5.0 inches. In the southern and western counties precipitation varied between 1.0 and 3.5 inches. For the State amounts ranged from 0.84 inch at Russellville to 9.54 inches at Frankfort. Moderate to heavy showers occurred generally in the eastern counties on the 8th and 11th, but were local in central and western sections. The showers periods of the [illegible] and 26-28th brought good rains to all districts, but they were heavier and more general in the central and eastern sections. The rainfall was considerably below normal in most south central and extreme western sections. Days with thunderstorms were: 3, 7, 10, 12, 13, 14, 15, 17, 20, 27.

MISCELLANEOUS.

River.—The run-off affecting the Ohio was larger than usual in this month. A considerable rise occurred from the 4th to 11th, followed by a slow decline to pool stages on the 26-27th. Stages fluctuated above pool levels most of the month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are included in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
+ Also on other dates. ‡ Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.
¶ Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Oneonta, California, Ky.

§ Incomplete record July 1, 2 3 etc., days missing from record.

W B O Louisville 9 35.45 11hr

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XL. LOUISVILLE, KY., SEPTEMBER, 1935. NO. 9

GENERAL SUMMARY.

Unseasonably cool weather during the first twelve days seriously delayed the growth of late crops. In the western counties a large proportion of the corn crop had just reached the silking stage. Its progress was halted so long that its later development was impaired. This spell of weather also held back the maturing of early corn and delayed the ripening of tobacco. Tobacco in barns cured so slowly that heating was frequently used to prevent sweating. The weather was generally unfit for making late hay.

The abnormally warm and dry weather, that followed in a period of equal length, decidedly improved crop prospects but could not entirely overcome the effects of the earlier delay. The high temperature, dryness, and sunshine advanced late corn rapidly and caused the larger part of it to mature. Some very green corn that would require two weeks or maturing remained on bottom lands in the western counties. A change to very cool weather in the last week again checked its progress and rendered its ripening doubtful. Decreasing soil moisture also acted to diminish growth.

During the warm period most of the remaining tobacco ripened and was cut. The fine weather soon brought about satisfactory curing which greatly improved the quality of the late crop. Because of cold winds the last four days were much less favorable for tobacco. An unusual amount of excellent late hay, made from beans, peas, alfalfa and lespedeza, was put up on account of this weather. It was the most favorable period for curing the heavy growths that had occurred for several weeks. After the middle of the month late potatoes did not have sufficient moisture in central, western, and southern districts. Plowing for grain and preliminary seeding were hindered by the increasing dryness. Showers in the last week were helpful but generally inadequate.

Hill and upland pastures began to deteriorate late in the month. Heavy frost on the 30th in the northeastern counties came too late to cause much damage. The frost was light in central districts.

TEMPERATURE.

Temperatures 5° to 10° below the seasonal average prevailed in the first two weeks and on the last four days. They ranged from 3° to 12° above normal in the period 13-16th. During the warm spell maxima above 90° were reported from most stations. Minima only a few degrees above freezing were registered in all sections on the 30th. Extremes for the state were 99° on the 21st and 31° on the 30th, both at Murray.

PRECIPITATION.

The rainfall averaged slightly less than normal for the state, but its areal distribution varied remarkably. In a broad belt extending from the south-central counties northeast to the upper Ohio and lower Big Sandy from 4.0 to 5.[illegible] inches occurred. Northwest and southeast from this belt of relatively heavy rain the amounts fell off rapidly to 1.5 inches or less near the Ohio River and the southeast border. The rainfall was far below normal in a wide section from the Purchase to the lower Licking River. Moderate rain fell in the western and north-central counties, and heavy rains in the remainder of the State, from the 2d to 5th. Most of the month's precipitation occurred in this period. Light showers were reported on the 9-10th and [illegible]. [illegible] Days with thunderstorms were: 2, 3, 9.

MISCELLANEOUS.

[illegible] The heavy rains early in the month caused a moderate rise in the Ohio [illegible] on the 4th, with [illegible] of the local flood on the 5th and nearly [illegible] to [illegible] feet. Streams in [illegible] counties were [illegible] and [illegible].

Temperature data are as read from self-registering thermometers.

Precipitation, temperature and wind movement are computed only for such stations as have ten or more years of record, but all complete reports are published.

Dashes indicate missing records, or data in regular reports from regular stations not received in time for compilation.

Normals, Records and Averages are based on the records at Louisville, Lock 41, Jessamine Co., Ky., for the Ohio River stations; Lock 7, Carroll Co., Ky.; Lock 14, Lee Co., Ky.; Lock 10, Clay Co., Ky.; Lock 9, Owsley Co., Ky.; Lock 8, Estill Co., Ky.; Lock 4, Anderson Co., Ky.; Lock 1, Oldham Co., Ky.; Lock 2, Shelby Co., Ky.; Lock 3, Henry Co., Ky.; Lock 5, Trimble Co., Ky.; Lock 6, Carroll Co., Ky.; Lock 7, Nicholasville, Ky.; Lock 10, Red House, Ky.; Lock 11, Estill Co., Ky.; Lock 12, Lawrenceburg, Ky.; Lock 13, Versailles, Ky.; Lock 14, Nicholasville, Ky.; Lock 16, Red House, Ky.; Lock 17, Frankfort, Ky.; Lock 18, Frankfort, Ky.; Lock 19, Frankfort, Ky.; Lock 20, Frankfort, Ky.; Lock 21, Frankfort, Ky.; Lock 22, Frankfort, Ky.; Lock 23, Frankfort, Ky.; Lock 24, Frankfort, Ky.; Lock 25, Frankfort, Ky.; Lock 26, Frankfort, Ky.; Lock 27, Frankfort, Ky.; Lock 28, Frankfort, Ky.; Lock 29, Frankfort, Ky.; Lock 30, Frankfort, Ky.; Lock 31, Frankfort, Ky.; Lock 32, Frankfort, Ky.; Lock 33, Frankfort, Ky.; Lock 34, Frankfort, Ky.; Lock 35, Frankfort, Ky.; Lock 36, Frankfort, Ky.; Lock 37, Frankfort, Ky.; Lock 38, Frankfort, Ky.; Lock 39, Frankfort, Ky.; Lock 40, Frankfort, Ky.; Lock 41, Frankfort, Ky.; Lock 42, Frankfort, Ky.; Lock 43, Frankfort, Ky.; Lock 44, Frankfort, Ky.; Lock 45, Frankfort, Ky.; Lock 46, Frankfort, Ky.; Lock 47, Frankfort, Ky.; Lock 48, Frankfort, Ky.; Lock 49, Frankfort, Ky.; Lock 50, Frankfort, Ky.; Lock 51, Frankfort, Ky.; Lock 52, Frankfort, Ky.; Lock 53, Frankfort, Ky.; Lock 54, Frankfort, Ky.; Lock 55, Frankfort, Ky.; Lock 56, Frankfort, Ky.; Lock 57, Frankfort, Ky.; Lock 58, Frankfort, Ky.; Lock 59, Frankfort, Ky.; Lock 60, Frankfort, Ky.; Lock 61, Frankfort, Ky.; Lock 62, Frankfort, Ky.; Lock 63, Frankfort, Ky.; Lock 64, Frankfort, Ky.; Lock 65, Frankfort, Ky.; Lock 66, Frankfort, Ky.; Lock 67, Frankfort, Ky.; Lock 68, Frankfort, Ky.; Lock 69, Frankfort, Ky.; Lock 70, Frankfort, Ky.; Lock 71, Frankfort, Ky.; Lock 72, Frankfort, Ky.; Lock 73, Frankfort, Ky.; Lock 74, Frankfort, Ky.; Lock 75, Frankfort, Ky.; Lock 76, Frankfort, Ky.; Lock 77, Frankfort, Ky.; Lock 78, Frankfort, Ky.; Lock 79, Frankfort, Ky.; Lock 80, Frankfort, Ky.; Lock 81, Frankfort, Ky.; Lock 82, Frankfort, Ky.; Lock 83, Frankfort, Ky.; Lock 84, Frankfort, Ky.; Lock 85, Frankfort, Ky.; Lock 86, Frankfort, Ky.; Lock 87, Frankfort, Ky.; Lock 88, Frankfort, Ky.; Lock 89, Frankfort, Ky.; Lock 90, Frankfort, Ky.; Lock 91, Frankfort, Ky.; Lock 92, Frankfort, Ky.; Lock 93, Frankfort, Ky.; Lock 94, Frankfort, Ky.; Lock 95, Frankfort, Ky.; Lock 96, Frankfort, Ky.; Lock 97, Frankfort, Ky.; Lock 98, Frankfort, Ky.; Lock 99, Frankfort, Ky.; Lock 100, Frankfort, Ky.

† Precipitation is less than 0.01 inch rain or melted snow. ‡Lone Oak.

Daily Precipitation for September, 1935.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XL. LOUISVILLE, KY., OCTOBER, 1935. NO. 10

GENERAL SUMMARY.

The dry weather that prevailed at the beginning of the month continued through the first three weeks. Fall plowing and seeding proceeded with increasing difficulty in muddy soil that toward the end of the dry period lacked moisture enough to sprout the grain. The showers that occurred on the 21st and 22d were beneficial in conditioning the soil and bringing about germination, but the rains did not penetrate deeply and the moisture content of the soil remained inadequate to maintain growth. In many places the showers were not even sufficient to bring up thinned. Good rains over the State in the last week, for the first time since seeding began, furnished moisture enough to insure general sprouting of grain and continued growth.

The long dry spell prevented late potatoes from developing sizeable tubers, and the heavy to killing frosts in the first week cut short the fall period of growth. They had already been seriously delayed by a decade of abnormally cool weather. The frosts caused extensive damage to late corn, especially in the western counties. Practically all tobacco had been saved before the frosts. They ended the tomato canning season rather early and damaged some late vegetables. The unvailing degrees increased the salvage of corn from the frosted portion of the crop by rapidly extracting the staples moisture from the ears before sprouting or molding could occur. The drying of corn and curing of late tobacco were accelerated by the high temperatures of the second decade. Cured tobacco could not be handled or stripped until the showery weather late in the month.

Pastures deteriorated steadily and became very poor. The first showers caused a slight revival and the rains near the end, in connection with the high temperature, brought about considerable growth. In the uplands and hilly sections water supplies for live stock continued deficient until the late rains. Pastures and sources of water supply needed much more rain at the end of the month.

TEMPERATURE.

Daily mean temperatures in the first week ranged from 8° to 23° below normal, with maximum on the 4th and 5th near freezing, and generally below freezing on the 7th. Mild weather followed in the second decade, when temperatures averaged 10 to 15° above normal. The warmth ended with another warm period of several days duration. Extremes for the State were 91° at several stations in the period 12-14th, and 22° at Farmers on the 7th.

PRECIPITATION.

The rainfall was above normal in some extreme eastern counties and the lower Ohio Valley, where it ranged from 3.01 to 5.6 inches at most stations. It was considerably lighter and generally below the average for this month in central and southern districts, where most stations reported 1.5 to 2.5 inches. The driest section included about twenty south-central counties, in which precipitation ranged from 1.2 to 1.7 inches. For the state amounts varied between 1.46 inches at Franklin and 7.1 inches at Lexington. Light and local showers occurred on few days in the first half of the month, except near the [illegible] were moderate to heavy in some places prevailed in the period 18-24th and 28-29th. These were the two rains of importance to crops in most sections during a dry interval nearly six weeks in length. Days with thunderstorms were: 12, 15, 16, 19, 20, 21, 22, 23, 28.

MISCELLANEOUS.

Rivers: All streams were low and run-off was light during the month.

PRESSURE, WIND, HUMIDITY AND SUNSHINE.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have 10 or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, a represents two days, etc.

a Also on other dates. b Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶Post-office address is Lock 3, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Oneonta, California, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak. §10.10.

VOL. XI. LOUISVILLE, KY., NOVEMBER, 1935. NO. 11

GENERAL SUMMARY.

High temperatures and moderate to heavy showers in the first half of the month caused marked improvement in autumn vegetation. Grains that had been sown late in dry and improperly pulverized soil started into rapid and vigorous growth. These late seedings had just come up at the beginning of the month, and needed a long period of favorable weather in which to make preparations for the winter. In the decade of abnormally high temperature, when growth was rapid, and another ten days with moderate warmth that permitted slow advancement, the most backward wheat, rye, and barley made sufficient progress to give the fields a green appearance. Some of the early sown grain reached the usual size for entering winter, but most of the acreage consisted of undersized plants when the hard freezes of the last week practically stopped its development. The unusual lack of sunshine was the most unfavorable feature during this period.

Precipitation occurred frequently in light to moderate amounts, which were often extended into long continued drizzles. The character of the rainfall, together with the persistent cloudiness, rendered most of the month too damp for shocked corn, and particularly unfavorable for the soft and partly frosted corn that had been cut late in the preceding month. The state of this corn induced early gathering, which was pushed as rapidly as possible in muddy fields and moist weather. As a result much corn was cribbed with its moisture content too high for satisfactory keeping. In the last decade several days with strong drying winds improved its condition both in shock and crib. The weather favored tobacco stripping, which progressed exceptionally well for this early stage of the work. Rye and grass pastures developed to a condition where some grazing was possible for two weeks or more. Abnormal cold near the end stopped their growth and increased feeding requirements.

TEMPERATURE.

Although the temperature averaged near normal, there were many sharp changes. The warmest weather occurred in the periods 1st-4th and 9-11th, when daily means ranged from 6° to 20° above normal and maxima reached 80° at some stations. In the short cold spells of the 22d-24th and 29-5 th minimum temperatures of 15° to 20° occurred quite generally. Extremes for the State were 85° at several stations from the 1st to 4th, and 11° at Farmers on the 24th.

PRECIPITATION.

Precipitation averaged slightly above normal, but varied considerably in distribution over the State. It was fairly heavy in the central and southeastern counties, where amounts ranged from 4.0 to 6.5 inches, with the wettest area in Bell and Harlan counties. From 2.0 to 3.0 inches occurred in most counties along the Ohio River. A broad belt south of the river counties received from 3.0 to 4.0 inches. Most of the rain fell in the period 6-13th, but local and irregular precipitation, which was heaviest in the southeastern counties, extended to the 20th. These rains finally overcame the local deficiencies in water supplies. Light to heavy rains occurred generally from the 27th to 29th. Snow flurries were reported from a few stations on the 29th. Precipitation for the State varied between 1.3 inches at Henderson and 6.62 inches at Harlan. Days with thunderstorms were: 9, 10, 11.

MISCELLANEOUS.

Rivers: The rains of the 10-13th caused some run-off that raised streams moderately, otherwise stages continued low.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

[Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

§Lone Oak.

* Also on other dates. † Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow

‡ Post-office addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Oneonta, California, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

( ) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak §10-10.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XL LOUISVILLE, KY., DECEMBER, 1935 No. 12

GENERAL SUMMARY.

The month averaged decidedly cold, with much inclement weather that was unfavorable for outdoor activities. Severe freezes in the first week stopped the growth of fall grains and pastures. Because the soil was relatively dry when frozen, grains suffered no apparent injury. This cold spell was followed by more than a decade of showery weather, in which there was some freezing and thawing but no special damage to grains. Soft and muddy fields during this period hindered corn gathering and caused farmers to center their attention on tobacco stripping, for which the long humid interval continued favorable. Many tobacco growers completed the preparation of their crops for market, while others succeeded in advancing the work farther toward completion than is usual so early in the winter. Although damp and rainy, the weather was too cold to permit much growth, therefore winter grains remained generally dormant after the hard freezes early in the month.

Unseasonably cold weather prevailed during the last two weeks, with temperatures frequently descending to zero. This cold spell was comparable in extent and severity with like periods in the coldest Decembers of the past. At its beginning the ground froze deeply without snow cover, but the top soil had drained fairly well and grain fields became solid without the usual lifting or heaving of the surface. A light snow that fell later made it convenient for several days to remove corn and fodder from the grain fields. Blizzard conditions on the 25th with light snow were followed on the 28th by heavy snow that remained on the ground at the end of the month. The dry cold seriously interfered with handling tobacco. Feeding requirements increased greatly and the milk supply diminished. Snow and ice on streets and highways impeded traffic and rendered travel unusually dangerous.

TEMPERATURE.

With the exception of 1919 and 1917, this was the coldest December since State averages were established. Mild weather prevailed in the period 7-9th and temperatures near normal from the 13th to 18th, otherwise daily means were abnormally low. After the 18th deficiencies ranged between 10° and 30° on most days. Temperatures below zero were registered generally on the 27th and 31st. The extremes for the State were 63° on the 9th at Harlan, and −14 on the 27th at Farmers and on the 30th at Taylorsville.

PRECIPITATION.

Precipitation averaged about two-thirds of the normal amount, and was rather evenly distributed over the State. At many central and eastern stations about one-half of it fell as snow. The snowfall ranged from 5.0 to 8.0 inches in the western division, 7.0 to 13.0 inches in the central counties, and 8.0 to 17.0 inches in most of the eastern third of the State. From 4.0 to 8.0 inches remained on the ground when the month closed. Snow occurred in moderate amounts in the period 22d-25th and in heavy quantities on the 28th. Moderate to heavy rain occurred in the period 6-8th, and showers that were heavy at some stations from the 11th to 13th. Precipitation ranged from 1.26 to 2.75 inches in the western counties and the valleys of the Green and Kentucky. East of the Kentucky River most stations reported 2.75 to 4.0 inches. The range for the State was between 1.21 inches at Pineville and 4.82 inches at Flemingsburg.

MISCELLANEOUS.

Rivers.—The Ohio rose rapidly from the 6th to 17th, then declined to a good stage as the cold spell began. Ice commenced to form generally on the 26th, followed by suspension of navigation in the section above Louisville on the 28th. A gorge developed at Madison, Ind., and the river remained nearly full of light to heavy ice to most of the upper section until the end of the month. During this period no marked confidence in the stretch below Louisville.

No temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. Jamestown, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

a Also on other dates. † Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

‡ Post-office at Pleasant Lock 5, Lawrenceburg, KY.; Lock 6, Versailles, KY.; Lock 9, Nicholasville, Ky.; Lock 10, Red House, Ky.; Oneonta, Catlettsburg, Ky.

Daily Precipitation for December, 1935.

Except as otherwise indicated observations are generally made at the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) R. solar Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

— Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than .005 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

‡ Lone Oak §0.10.

Daily Temperatures for December, 1835.

VOL. XL. LOUISVILLE, KY., ANNUAL, 1935 No. 13

GENERAL SUMMARY.

Heavy rains late in January finally replenished surface water supplies in the northern and eastern uplands. They softened the subsoil for the extensive plowing that followed in the mild and relatively dry February and the first decade of March. Excessive and prolonged rainfall in March, particularly in the southern half of the State, prevented most spring work and started the wet spell that continued with brief interruptions until late in June. This wet weather was most pronounced and damaging in the southern and western districts. The earlier rains of the wet period benefited the northern and eastern uplands by further additions to ground water. In those sections the dry intervals were longer, and interference with seasonal planting and cultivation was less serious.

Abnormal warmth in February and March advanced early vegetation to a remarkable degree, resulting in extensive damage to the prematurely developed fruit by the severe freezes near the middle of April. The persistent low temperatures of April, May and June adversely affected planting and spring growth. The injurious effects of this long cool period with its lack of sunshine, were most seriously felt in the flat and lowland districts of the western counties, where crops were drowning from standing water and supersaturation of soil. Except in the well drained uplands, where fairly good cultivation was possible, extreme weediness resulted from these conditions. The prevailing high temperature of July and August partly overcame the effects of the cool early season, but on account of weediness and lack of sufficient cultivation, as well as deficient rain in considerable sections, the heat was often more injurious than helpful. The change to dry warm weather came in time for wheat harvest, but was too late to fill the heads. Cool weather in September delayed maturing of crops, but the light rainfall was more favorable than otherwise for late tobacco and corn. Warm weather in October and a general moisture deficiency hindered fall plowing and seeding. Grains germinated unduly late and grew too slowly. The November warmth and moisture greatly improved their condition and caused them to develop to fair size before growth ceased. Frequent light rains and long periods of moist atmosphere in November and December were exceptionally favorable for handling tobacco.

The Weather By Months.

JANUARY.---Mild weather during the first three weeks started grass and winter grains. Swollen buds appeared on early blooming trees and shrubs. Because of the relative dryness of the surface soil, the freezes late in the month had no injurious effect of consequence on wheat. Dry weather interfered with tobacco handling.

FEBRUARY.---Frequency and duration of precipitation favored the stripping and marketing of tobacco. The untimely advance of vegetation was checked by a cold wave near the end. Moisture continued to drain into the subsoil, leaving the surface of grain fields in good condition to withstand the freezes.

MARCH.---Most tobacco plantbeds were sown during the dry period early in the month. The wet weather that followed prevented potato planting and early gardening. The humid conditions favored the completion of delayed tobacco stripping and marketing.

APRIL.---Wet weather prevented the sowing of most oats, and delayed gardening and potato planting. Floods that covered about 75,000 acres of western bottom land subsided during the third week. Wheat and grass grew rank on uplands, but were largely drowned by standing water on low ground.

MAY.---There were only two short periods favorable for corn planting. Wet weather largely prevented the preparation of corn and tobacco land. Cloudiness and showers interfered seriously with early haymaking. Gardens were exceptionally backward and poor.

JUNE.---Gardens, potatoes and other early crops suffered from weediness and lack of cultivation. Heavy rains caused lodging of wheat and damaged shock barley. Corn planting continued when possible, but much land in the western counties could not be made ready.

JULY.---Early corn could not be given thorough cultivation, and was laid by in poor condition to resist mid summer heat. Hardpanning of soil interfered with tillage. The poor quality and yield of grain showed the effect of the wet spring.

AUGUST.---The dryness of the first half retarded tobacco, but rapid growth followed the rains of the third week. The warm dry weather of the first two weeks favored late crops and favored the making of hay. Late potatoes did not have enough moisture. Hill and upland pastures began to deteriorate.

SEPTEMBER.---Rough pressure and dry weather in the last half of the month helped late crops and favored the making of hay. Late potatoes did not have enough moisture. Hill and upland pastures began to deteriorate.

OCTOBER.---Showers late in the month were beneficial for seeding, but inadequate to maintain growth. Late potatoes failed to develop completely. Frosts in the first week caused extensive damage to late corn. Pastures became very poor.

NOVEMBER.---Fall grains did not reach the usual size before growth ceased. Cloudiness and extended rainfall were unfavorable for shocked corn. Pastures revived to grazing stage before the freezes stopped their growth.

DECEMBER.---Muddy fields in the first half and severe weather with heavy snow later on interfered with corn gathering. The soil froze deeply without cover, but its well drained condition prevented much damage to grains.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing: for example, b represents two days, etc.

NOTE. Tables and charts giving climatic data for Kentucky in detail during 1935 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in Charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1929.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XLI LOUISVILLE, KY., JANUARY, 1926 No. 1

GENERAL SUMMARY.

Mild weather prevailed during the first 18 days, with mean temperatures generally above normal. A change to much colder on the 19th was followed by 10 days of unusually severe conditions, with temperatures descending far below zero. At some northern stations the average temperature for the week ending on the 28th was the lowest, with the exception of the week of February 7-13th, 1899, since State records were established. The severe cold caused extensive damage to peaches in the western counties, and destroyed practically all buds in the northeastern districts.

The snow of the preceding months melted off in the first week, revealing the winter grains in good condition and apparently benefited. After the disappearance of the snow sandy soils and well drained uplands dried out sufficiently that plowing became possible. In some western and southern counties considerable land was plowed before the cold weather put an end to such work. Temperatures during the first three weeks were favorable for handling tobacco, and the frequent light showers usually furnished enough atmospheric moisture to condition the leaf. The mild weather enabled farmers to finish gathering corn. A snowfall that was light in the western counties and moderate to heavy in eastern districts preceded the cold spell, furnishing considerable protection to winter grains and meadows. Because of the scanty precipitation ahead of the severe cold, the soil of grain fields drained well and was in good condition to freeze solid without pushing out the plants. At the beginning of the last week, additional snow, which was heavy east and generally light west, gave further protection to grains.

The dryness of the cold period and the discomfort resulting from attempts to handle tobacco practically paralyzed the work of stripping and marketing. Some markets closed on the coldest days. Unusual difficulty was experienced with frozen water supplies. Milk and egg production fell off sharply. Exceptional efforts were required to save young animals. About double the usual time in transit became necessary on the railroads, and truck traffic was seriously impaired.

TEMPERATURE.

Despite the mildness of the first half of the month, when daily mean temperatures ranged from 5° to 20° above normal on most days, the extraordinary deficiency that accumulated after the 18th brought the average temperature down among the low records. In the cold period daily averages were 10° to 35° below normal. From the 22d to 31st temperatures below zero were reported on six days and only slightly above zero on two others. The extremes for the State were 68° at Murray on the 12th and -25° at Taylorsville on the 28th.

PRECIPITATION.

Precipitation averaged near normal in the southeastern counties, where it ranged from 4.0 to 5.0 inches. Northward from this section it diminished rapidly to 1.5 or 2.0 inches along the Ohio River, and averaged about one-half of the normal amount. The range for the State was between 0.95 inch at Owensboro and 5.69 inches at Jackson. Moderate to heavy rain occurred in the periods 2d-9th and 18-19th. These rains were lighter and less frequent in the western division. Moderate to heavy snow fell generally on the 19th and light snow almost daily thereafter. In the eastern counties the snowfall was moderate to heavy on the 25th. For the State the average ranged from 1.0 inch in the extreme western counties to 10.0 inches in the eastern mountain valleys. A limited area in the central bluegrass region received 14.0 to 18+ inches.

MISCELLANEOUS.

Floods.—A rise from rain and melting snow started on the 3d and culminated in the upper Ohio with moderately high stages on the 8th and 9th. Flood stages were slightly exceeded in the Evansville and Cairo districts from the 12th to 16th, after which the river declined slowly. Ice began to run in the upper reaches on the 23d and in the middle and lower sections on the 24th. From that time on the Ohio remained from half full to nearly full of ice. Navigation closed on the 27th. The river resisted gorging and freezing because of the moderate stage during the entire period.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow

* Also on other dates. †† Received too late to be included in means and summaries

§Lone Oak.

¶ Post-office addresses: Lock 5, Law rencburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Omeania, California, Ky.

Daily Precipitation for January, 1936.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‡‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. ¶Love Oak §10.10.

Daily Temperatures for January, 1936.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

J. L. KENDALL.

VOL. XLI LOUISVILLE, KY., FEBRUARY, 1936 NO. 2

GENERAL SUMMARY.

The severe cold spell that began in the preceding month continued with brief intervals of thawing until the 21st. In the last week normal or considerably higher temperatures caused the ground to thaw out completely and settle sufficiently that fields could be entered for sowing to clover and lespedeza. Freezing to depths as great as 22 inches was reported from western districts at the close of the cold spell. In the northern counties water pipes were frozen at greater depths than in any winter since 1917-18. This deep freezing was disastrous to the various types of macadam roads. Even the roads treated with oil or tarvia gave way under the usual traffic as they thawed through.

Comparatively light snow cover in central and western districts melted off at times and exposed winter grains to sudden and severe freezes with resulting injury. The snow accumulation was much heavier in the eastern counties, where grains had better protection. The disappearance of the snow about the 21st revealed serious damage to grains especially in the northern counties. The extent of damage depended on the type of soil, as well as the amount and duration of snow protection. Two short periods of excess warmth in the last week started slight growth, which showed that most wheat plants were alive although often small and weak. Grains were generally in much better condition in the southern counties. Bluegrass on warm slopes began to grow slowly at this time.

The cold dry weather was very unfavorable for stripping and marketing tobacco. It was only during the brief moist periods when temperatures were moderate that much progress could be made. The severe cold made difficult the preservation of young livestock and caused some loss. On the last two days the ground became dry enough that tobacco plantbeds could be burned and sown, but the work had barely commenced when the month closed. After the thaw the ground remained too wet for plowing. On account of the thorough freezing and absence of heavy rainfall, land already broken was in excellent condition for further preparation when sufficiently dried.

TEMPERATURE.

On most days during the first three weeks mean temperatures ranged from 5° to 35° below normal, with the greatest deficiencies in the periods, 1st, 5th, 9-10th, and 17-20th. In the eastern counties the coldest day was the 1st, when temperatures ranged from 0° to −14°. In other sections the lowest temperatures were registered on the 18th, with minima of −3 to −10° at most stations. Except on two days when temperatures were near normal, daily averages in the last week ranged from 10° to 20° above the seasonal mean. Extremes for the State were 79° at Farmers on the 26th, and −14° at Taylorsville and Farmers on the 1st.

PRECIPITATION.

Precipitation averaged slightly more than half the normal amount. From 2.0 to 2.5 inches occurred in a large district in the western division, a few extreme northern counties, part of the central bluegrass region, and the southeastern mountain counties. In the remainder and larger portion of the State amounts varied between 1.2 and 2.0 inches. The range for the State was from 1.01 inch at Ford to 3.29 inches at Middlesboro. One-third or more of the precipitation occurred as snow, which fell heaviest about the 2d and 13th. Most stations in the eastern and western divisions reported a total snowfall between 8.0 and 11.0 inches. The central counties received from 3.0 to 5.0 inches. Moderate to heavy rain occurred on the 4th at central and eastern stations, and on the 13th in the central and western districts. Moderate rains were fairly general on the 27th. Light precipitation, usually in the form of snow, occurred on the periods 1st-2d, 7-8th, and 14-18th. Thunderstorms were reported from extreme western districts on the 26th.

MISCELLANEOUS.

Rivers.—A sharp rise started in the upper river on the 27th due to rain and melting snow in the basins of southern tributaries. Light rain and melting snow started another and more rapid rise on the 28th, that continued with moderately high stages in the upper river at the end of the month.

Heavy ice ran in the Ohio during the first three weeks. Navigation was resumed between Louisville and Cincinnati on the 24th. A small amount of ice was running as late as the 28th.

An ice gorge formed in the lower Ohio near Golconda, Illinois on the 7th and held until the 24th. Heavy ice passing down against the gorge filled the river to stream to Dam 47 above Evansville. The backing of the water above the gorge caused the river to rise considerably above flood stage at Dam 47, Evansville and Lock 48, and continue above flood in that section from the 20th to 26th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
* Also on other dates. ** Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow.
Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Oneonta, California, Ky.

Daily Precipitation for February, 1936.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

†Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

*Lone Oak

Daily Temperatures for February, 1936.

VOL. XLI LOUISVILLE, KY., MARCH, 1936 No. 3

GENERAL SUMMARY.

The month was warmer and drier than normal, with a generous amount of sunshine, consequently progress in plowing and early planting was better than usual. During the first two weeks the light precipitation scarcely interrupted farm activities. The dryness and moderate to high day temperatures provided ideal conditions at the proper time for sowing tobacco plant-beds. This weather also favored spring seeding on grain fields. Potato planting and preparation for early gardens advanced quite rapidly in the southern and western counties. During the last half of the month the weather was less favorable, because of frequent showers and considerable snow. Farm and garden activities that had commenced earlier proceeded intermittently, with soil often too wet. Progress was fairly good in the extreme western counties and generally poor in eastern districts, where rain and snow were heaviest.

Because of its dryness and the deep winter freezes, the soil worked remarkably well. Heavy rains that were inclined to cause packing occurred late in the month in the Green River Basin. A large amount of plowing was accomplished before the middle of the month, after which progress was mainly confined to some southwestern districts.

Short periods of subnormal temperature, with frequent freezes restrained growth during the first three weeks. The warm weather of the last decade caused grass and grains to show decided advancement. Some bluegrass on warm slopes became available for grazing.

Wheat, rye and barley grew from small size and apparent weakness to good size and condition. On account of sunshine and favorable temperatures, the improvement in winter grains was greater than their early appearance indicated as probable. Tobacco plants came up shortly after the middle of the month, and some in the southern counties had four leaves at its close. In the last week peaches, plums, and pears were blooming in the extreme west and south. There seemed to be practically no peach buds surviving in the northern districts.

TEMPERATURE.

Moderately low temperatures prevailed during the third week and on a few other days scattered through the month. Daily averages ranged from 8° to 15° above normal in periods of considerable length in the first half of the month and during the last week. Monthly mean temperatures ranged from 4.0° to 6.0° above the average for the month. The extremes were 81° at Murray on the 30th and 19° at Farmers on the 6th.

PRECIPITATION.

Precipitation averaged near normal, but was rather unevenly distributed. From 5.0 to 7.0 inches occurred in the south-central counties, including most of the Green River Valley and a belt across the southern bluegrass region. Similar amounts were recorded in some southeastern districts. In the northern and extreme western counties most stations reported from 3.0 to 4.5 inches. The range for the State was between 2.99 inches at Louisville and 7.79 inches at Russellville. The total snowfall varied from flurries in western districts to about 3.0 inches in the section immediately west of the mountains. The mountain region received from 6.0 to 16.0 inches, most of which fell on the 16th and 17th. The heaviest snow occurred in the valley of the Big Sandy and the extreme upper valleys of the Kentucky and Cumberland. Precipitation was light and scattered in the last two weeks. Heavy rain occurred from the 14th to 18th, and moderate to heavy rain in the periods 20th-21st, 23d-24th, and 26-27th. Days with thunderstorms were 1, 2, 15, 16, 23, 24, 26, 27, 30, 31.

MISCELLANEOUS.

Rivers:—The Ohio passed flood stage in the upper section on the 26th, and along its middle course on the 23d. It continued above flood levels until the end of the month. The crest at Cincinnati was 60.6 feet on the 28th and at Louisville 36.6 feet, upper gage, 65.6, lower gage, on the 28th. There was extensive overflow of bottom farm lands along the Ohio and the Green rivers with damage to crops by standing water and deposits of mud. Roads along the Ohio were overflowed in places.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. ††Received too late to be included in means and summaries

VOL. XLI LOUISVILLE, KY., APRIL, 1936 NO. 4

GENERAL SUMMARY.

The month was unseasonably cold, with much wind and less than normal sunshine. It was only slightly warmer than March preceding, and but little more favorable for growth. Most vegetation developed with exceeding slowness, and at the end of the month was far behind the seasonal stage. Heavy and frequent precipitation in ths first decade prevented field work. Strong winds and more generous sunshine in the two weeks that followed dried the ground rapidly and permitted the delayed potato planting and oats sowing to be completed. Except for some cool weather vegetables, gardening was held in abeyance until the last week, because the temperature continued too low for most seeds to germinate. The last killing frost occurred in most districts on the 23d.

Although much land was prepared for corn in the last two weeks, the cool weather discouraged planting. Some corn was planted in the warmer upland soils of the southern and western counties late in the third week, but progress with this work was slow until the warm days near the end of the month brought more favorable conditions for germination,

Some tobacco plants were up in the southern counties at the beginning of the month, but they had not appeared in most beds in the central and northern districts. Plants kept coming up in straggling fashion during the first three weeks. The latest had only four leaves at the end of the month, while those in some favored beds near the south border were almost normal size. As a rule they averaged about two weeks late.

Wheat, rye, and barley made fairly good progress on the warm uplands and slow growth on the colder soils. Wheat reached the jointing stage in the last week, but apparently was not injured by the latest freezes. Pastures developed irregularly and were very slow in providing sufficient grazing. The persistent low temperature accentuated the differences in growth on the warm and cold types of soil. Flood water drained off the western lowlands in the last week, but none of the overflowed ground could be worked. Late in the month it became evident that about one-third of the peach buds had survived in the extreme western counties, but prospects diminished eastward to practically nothing in central districts.

TEMPERATURE.

Daily mean temperatures during the first decade averaged about 10° below normal, with minima frequently below freezing. Cold weather equally abnormal also occurred in the periods 16-19th and 21st-24th. A few days near the middle and at the end had temperatures above the seasonal average. Extremes for the State were 19° at Anchorage on the 8th and 90° at Mayfield and Quicksand on the 15th.

PRECIPITATION.

Precipitation averaged considerably above normal and was well distributed over the State. In a few extreme northern counties monthly amounts ranged between 3.6 and 4.0 inches. Most other parts of the State received from 4.0 to 5.0 inches. In a small area north of the lower Green and another in the upper Licking Valley more than 6.0 inches occurred. Rain in measurable amounts was reported daily in the period 1st-12th. The rainfall was heavy locally on the 5th, 6th, and 7th. Light to moderate showers of a local character occurred in the periods 11th, 21st-22d, and 28th-30th. Snow (flurries) were reported generally on the 2d and 3d, and a few stations in the mountain region received 1 inch or more. The precipitation extremes were 5.2 inches at Owensboro and 7.78 inches at Mt. Sterling. Days with thunderstorms were 1, 5, 21, 1, and 2.

MISCELLANEOUS.

April 1.—Damage by wind in Hopkins County was estimated at $15,000. Barns and small buildings were unroofed or blown down and trees were uprooted in the section between Hopkins and La Rue County. Hail at Madisonville caused some windows and greenhouses.

April 5.—Hail and heavy rain, driven by a high wind, damaged the fruit crop, windows, auto tops, and tobacco plantbeds in Henderson County. The loss from hail was estimated at $25,000. Some buildings were unroofed and trees uprooted in Jefferson County.

Rivers.—The River subsided slowly from its high stage during the first 9 days to stages below flood levels in the section above Dam 44. Heavy rains on the 4th caused another rise that brought crests somewhat above flood stage in the upper and middle sections, and increased the flood in the lower river. It continued to flood stage on the 12th in the Cincinnati district, on the 13th at Louisville, on the 22d at Evansville and on the 28th at Cairo. Lowlands along the lower Ohio and the lower Green had been flooded for four to five weeks when the water finally drained away near the end of April.

Dots in temperature data are taken from soil-registering thermometers.

Dots in departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries. ‡ Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶ Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Oneonta, California, Ky.

Stations, Counties, Observers, and extremes ...

Lockmasters, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Daily Precipitation for April, 1936

Except as otherwise indicated observations are generally taken in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(‖) Precipitation measured in the following amount fell recorded in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking, (K) Kentucky, (S) Salt; (G) Green, (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

* Lone Oak

Daily Temperatures for April, 1936.

UNIV OF

GENERAL SUMMARY.

Ths month was dry, and somewhat warmer than the average, with an exceptionally high percentage of sunshine. More rapid growth than usual made up to a considerable extent for the delay in the earlier part of the spring. The lack of sufficient moisture in the soil of uplands and hills began to show about the middle of the month in the diminishing growth of pastures. Toward the end the increasing dryness retarded such crops as potatoes, timothy, lespedeza, young clover, and most vegetables; while hill pastures, seed bluegrass, and oats were more or less seriously damaged. Corn planting proceeded almost without hindrance until near the end, when land became too dry to be properly conditioned. Germination was prompt and good stands resulted. The rapid drying out of plowed land and the difficulty in preparing a good seed bed rendered the sprouting of the last plantings, uncertain. Some plowed land lay unplanted at the end on account of this situation. Plowing could not be completed because of the hardening soil.

Tobacco plants improved rapidly during the first two weeks, but suffered for moisture later on. Transplanting began somewhat later than usual, and was confined to the smoother lands on which machines could be used. After plants became large enough to set there was no rain that would permit transplanting in the hilly districts. The lack of rain after setting was unfavorable for obtaining perfect stands and for starting growth. Wheat improved in color and condition. On the uplands the dry weather caused variation in length of straw which showed as heads appeared. Barley harvest began in southern districts near the end with ideal weather for curing. First crop alfalfa matured rather quickly and was perfectly cured.

The dry weather prematurely ended the strawberry season, and reduced the size of berries in the later stages. Other small fruits were damaged. Cotton was planted somewhat late, but made exceptional progress. The increasing distress of vegetation indicated low moisture reserves in the soil, especially of the thinner uplands and hills.

TEMPERATURE.

With the exception of brief periods of cool weather in the first week, near the middle, and at the end of the month, daily mean temperatures averaged considerably above normal. The periods 6-12th and 22d-27th, were especially warm, with means 7° to 15° above normal and maxima frequently above 90°. The highest for the State was 96° at several stations on the 9th-10th, and the lowest 35° at Greensburg on the 15th.

PRECIPITATION.

Precipitation averaged slightly more than one-third of the normal amount, and ranged between 0.43 inch at Middlesboro and 4.63 inches at Berea. It occurred as irregularly distributed showers in the periods 1st-4th, 11-14th, and 17-19th. These showers were moderate to heavy locally on the 12th, 13th, 18th, and 19th. A narrow strip about one county in width, extending from Boyle to Rowan County, received 2.0 to 4.0 inches. In most other sections monthly amounts ranged from 1.0 to 2.0 inches. Very dry areas, with less than 1.0 inch, developed along the Ohio River from Breckenridge to Boyd County, a so in the southeastern, south-central, and extreme western counties. Days with thunderstorms were: 1, 2, 9, 10, 11, 12, 13, 17, 18, 24, 25, 26.

MISCELLANEOUS.

Rivers: – The Ohio declined to pool stage by the middle of the month. All other streams remained low. Water shortages appeared in some dry upland sections toward the end of the month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Ransey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
Reference letters, *, †, ‖, appearing in the table indicate number of days missing; for example, b represents two days, etc. ¶ Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.
* 3 to 5 on other dates. †† Received too late to be included in means and summaries.
Post-office addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky; Lock 10, Red House Ky.; Oneonta California Ky.

Daily Precipitation for May, 1936.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. ▼ Precipitation included in the next following measurement.

& Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak

J. L. KENDALL.

VOL. XLI LOUISVILLE, KY., JUNE, 1936 No. 6

GENERAL SUMMARY.

The month was the driest of the name on record, and probably the most disastrous in its effect on crops. At its beginning the dry weather had already begun to affect growth. Much of the State received only negligible amounts of rain, which merely moistened the surface or dried up within a day. On the thin uplands corn was curling in the noonday heat by the middle of the month, and similar evidence of distress had appeared in corn on the best lands by the close. Because of its excellent state of cultivation the earlier portion of the crop exhibited unusual resistance as the drought increased. Late plantings came up imperfectly or failed to germinate. Cool nights and temperatures below normal in brief periods aided vegetation in its resistance to injury.

There was never sufficient rain over any large area of the hilly district to set tobacco with the assurance that it would survive. As a result very little tobacco was put out in the hills. Where machines could be used transplanting continued until late in the month, with chances of obtaining a stand becoming more uncertain. Plants died slowly as their water supply evaporated. Attempts to replant exhausted the beds and met with the same result. At the end of the month tobacco was merely standing, without growth of consequence.

Wheat and barley ripened perfectly and were harvested in excellent condition. The threshed grain weighed unusually heavy. Oats and potatoes almost completely failed. Young clover died out as the month advanced, and lespedeza barely survived. Alfalfa withstood the drought better than other crops. Pastures failed about the middle of the month, and milk production fell off decidedly. Feeding of dairy cattle on a winter basis became necessary. Small streams dried up and water supplies for livestock dwindled seriously.

Gardens produced practically no vegetables. Field tomatoes merely stood without growing. Crop conditions at the end of the month were regarded as worse than at this date in any previous dry spell of record.

TEMPERATURE.

Short periods of cool weather occurred in the first and second weeks, and also near the end, otherwise daily temperatures ranged from 5° to 10° above normal. The contrast between day and night resembled conditions in semi-arid regions. While night temperatures averaged near or slightly below normal, day temperatures were 4° to 6° above normal. A wave of heat in the last four days lifted maxima to record heights on the 29th, when they ranged from 100° to 110° in most of the State. The highest was 110° at St. John on the 29th and the lowest 40° at Quicksand on the 1st.

PRECIPITATION.

Precipitation averaged near 2¼ per cent of the normal and set a new record for this month. It occurred as local showers, distributed in scattering fashion through the periods 4-12th, 17-18th, 21st-23d, and 28th-31st. A limited area in Lewis County, also in Clay and Knox counties, received 3.0 to 4.0 inches. From 1.0 to 2.0 inches occurred over most of the southeastern mountain district, and in some localities in the western division. Most of the State received less than 1.0 inch, and about half of the main agricultural section 0.5 inch, or less. The range was 0.01 in a trace at Mt. Sterling and 4.88 inches at Barbourville. Days with thunderstorms were: 2, 3, 6, 7, 10, 17, 18, 22, 23, 30.

MISCELLANEOUS.

June 30.—Forest fires raged in many places in the timber of the mountain counties. A windstorm at Paducah caused a fire loss of $50,000. Wind caused damage to chimneys, signs, awnings, and trees at Hopkinsville, Maysland and Catlettsburg. Damage by hail occurred at Morehead and Olive Hill.

Rivers.—The flow diminished in all streams. Headwater tributaries reached very low stages and a considerable proportion of creeks in uplands ceased to flow.

A dash (—) indicates data are taken from self-registering thermometers.
Two decimals (.00) from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. †‡ Received too late to be included in means and summaries.
¶ Post office addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 11, Red House Ky.;
Oneonta, California, Ky.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

Daily Precipitation for June, 1936.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T, Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

VOL. XLI LOUISVILLE, KY., JULY, 1933 No. 7

GENERAL SUMMARY.

Heavy rains early in the month relieved the drought in the southwestern and south-central counties. In the third week heavy rainfall spread north over the central districts and started growth. Additional moderate to heavy rains visited the southern counties in the last week. Near the Ohio River, and for several counties southward, the rainfall was local and generally insufficient. Many sections received so little that there was no effect on crops, while pastures remained parched and the water situation grew worse.

The extreme heat of the period 8-15th caused great damage to corn pollen and almost complete cessation of growth in the dry sections. Only limited areas in the south and extreme east had received enough moisture to enable corn to resist. Even in the best fields of corn, partly filled ears showed the disastrous effects of the high temperatures. Later in the month after the rain had reached most of the State, the tasseling of late stalks of corn provided pollen for silks that appeared on other stalks with dried tassels. At the end of the month good growing conditions prevailed in the southern half of the State, and extended irregularly northward into the dry half. Tobacco and pastures improved rapidly in that section, but remained poor to worthless farther north toward the Ohio River. Local showers and lower temperatures in the last half permitted the planting of late potatoes in the principal districts devoted to that crop. Domestic and commercial gardens failed to produce in most sections, but were recovering late in the month in the southern and central counties. Field tomatoes merely stood without setting fruit. Some interesting features of the drought were the failure of alfalfa to produce a third crop, the resistance and continued slow growth of soy beans, and the general failure of all plants to pollenize. While recovery was under way in the southern half of the State at the end of the month, extreme irregularity and spottedness characterized the agricultural situation in northern districts.

TEMPERATURE.

Except for a few days at the beginning and end of the month, temperatures were continuously above normal. From the 7th to 15th the excess was 10° to 15° at most stations, and maxima ranged from 100° to 110°. This was the longest period with such excessive heat in the climatic history of the State. High temperatures also prevailed from the 26th to 28th, with maxima of 100° to 106° at many stations. The highest was 113 at Henderson on the 13th and the lowest 46° at Farmers on the 31st.

PRECIPITATION.

The precipitation average for the State was not far below normal, but the contrasts in its distribution were extraordinary. In the southern part of the Purchase, the south-central counties and northward across the middle of the bluegrass region, also in the eastern mountain districts, it ranged from 4.0 to 8.0 inches. In a belt along the Ohio, and to the depth of several counties toward the interior in the lower Green River section and the upper Licking River valley, amounts ranged from 1.5 to 2.5 inches. The driest areas were near the Ohio River from the lower Cumberland [illegible] counties. Showers occurred rather generally in northern [illegible] irregularity in a number of instances. [illegible] at Louisville on the 4th and 5th, in many districts. The greatest [illegible] at Lexington and 8.5 inches at Middlesboro on [illegible] 5, 11, 12, 15, 16, 19, 20, 21, 22, [illegible] 30.

MISCELLANEOUS.

July 29.—Fire [illegible] by heat at Hazard, [illegible] [illegible] [illegible]

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XLI LOUISVILLE, KY., AUGUST, 1936 NO. 8

GENERAL SUMMARY.

Moderate to heavy rains in the first week brought temporary relief from drought to most of the dry northern half of the State. These rains brought out silks on some corn stalks with dried tassels, and developed tassels on later stalks, with the result that limited pollenization occurred and ears formed. Much tobacco reached topping size after the rains. All late crops resumed their growth and improved for a time, but the dry weather that followed checked progress or caused additional damage. Growth slackened rather speedily in the dryness and excessive heat of the last three weeks. Corn hardened and ripened prematurely, followed by cutting in most sections. Tobacco fired so seriously, especially in the burley district, that it had to be cut.

Heavier and more general rains occurred in the southern counties in the same districts that received good rains in the preceding month. Growing conditions continued fairly good during most of the month in that part of the State, and were practically normal in limited areas. Toward the end, however, crops began to suffer in those southern localities that had received the lightest rainfall.

Pastures partly recovered in the northern counties, only to dry up again later in the month. Continued high temperature hastened the return of deterioration. In southern districts pastures remained fair to good during most of the month, but became more variable toward the end. The heat and drought practically stopped the development of late gardens in the middle and northern counties. Because of the extreme heat, field tomatoes failed to set much fruit. Such fruit as appeared often blistered or failed to mature. Late potatoes came up to a poor stand and grew slowly. Late forage crops sown after the rains had their growth much retarded. Third crop alfalfa gave light cuttings, and the fourth crop was even less promising. Undersized tree fruits also showed the extreme depletion of subsoil moisture. Considerable plowing occurred after the early rains, but gradually ceased as the ground dried out. In the uplands the hauling of water for livestock and domestic use increased toward the end.

TEMPERATURE.

At some northern stations the average temperature was the highest of record for this month. In the period 13-28th the daily excess ranged from 8° to 15° and maxima of 105 or higher were recorded almost daily. High night temperatures made this warm period much more uncomfortable than usual in this month. In average temperature and length of the hot period there was but little difference between this month and the month preceding. The extremes were 108° at Henderson on the 17th and 18th, at Williamsburg on the 19th and at Eubank and Greensburg on the 21st, and 43° at Greensburg on the 31st.

PRECIPITATION.

Precipitation for the State averaged about half the normal amount. Its distribution was extremely irregular, varying from merely a light shower or two in the Purchase to somewhat more than normal near the eastern boundary. Limited areas immediately east of the lower Cumberland, in the upper Cumberland Basin, and in the eastern mountain Region received from 3.0 to 5.0 inches. In the extreme western counties, parts of the lower Green River Valley, and the southern Bluegrass regions [illegible] much occurred. [illegible] ranged from [illegible] to 2.5 inches. Stored [illegible] and [illegible] in the [illegible] and [illegible] about half of the [illegible] [illegible] deficiencies [illegible] [illegible] [illegible]

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, [a], [b], [c] appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. †† Received too late to be included in means and summaries T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Omeonta, California, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for August, 1936.

VOL. XLI LOUISVILLE, KY., SEPTEMBER, 1936 No. 9

GENERAL SUMMARY.

Improvement in late crops, especially tobacco, followed the moderate to heavy rains early in the first week. The abnormal heat of the second decade caused such rapid loss of soil moisture that growth was soon checked. Pastures improved temporarily in about half of the State, then suffered further deterioration. Largely due to the effect on maturity of the high temperature that prevailed during the first three weeks, the cutting of burley tobacco was completed before the close of the month. Some late tobacco of the dark variety remained out in the western counties. Prior to the rains and change to cooler near the end, the weather was exceptionally favorable for air curing. Corn dried very rapidly and cutting advanced toward completion.

Heavy rains that visited most of the State early in the last week came too late for most corn and tobacco. Some very late corn in the roasting ear stage, that remained in the western bottoms, was helped; but cool weather and lack of sunshine after the rains delayed its development. Late potatoes were also benefited, but their growth had been so retarded by the preceding dry weather that they required a prolonged and very favorable growing season to mature. Field tomatoes, which had suffered severely in the heat and drouth, recovered to some extent. The most important results of these rains were their beneficial effects on plowing and seeding, the restoration of pastures, and the replenishment of water supplies for livestock. The moisture greatly improved the seedbed in land already prepared, made possible more thorough preparation, and insured germination of grain recently sown or yet to be planted. In some southern and eastern counties the soil remained too dry for satisfactory seeding.

Corn cutting and some early husking revealed that what appeared to be an ear was often merely a cob with scattered grains. This effect of the extreme heat at time of pollenization was shown to have caused more extensive damage to early corn than its appearance indicated.

The cloudy weather, with low temperature and cold winds, in the last week was unfavorable for all growth. Pastures revived slowly, and late vegetables made poor progress.

TEMPERATURE.

Except on a few days at the beginning and near the end, the temperature was continuously above normal. The daily excess ranged from 5° to 15° in the periods 5-16th and 20th-23d. Maxima of 95° to 100° were registered at nearly all stations in the warmest interval from the 8th to 16th. The nights were relatively warm until the 23d. The highest was 101° at Mammoth Cave on the 12th, Lexington on the 14th and Eubank on the 16th. The lowest was 41° at Maysville on the 25th.

PRECIPITATION.

Precipitation for the State averaged considerably above normal, but varied greatly in different regions. It was far in excess of normal in some central and western counties, but was less than the seasonal average in large southern and northeastern areas. From the central bluegrass region westward and in a few eastern mountain counties, amounts ranged from 4.0 to 6.0 inches. Toward the northeast, south, and southeast from this moist area the rainfall decreased irregularly to less than 2.00 inches at some stations near the border of the State. Except for a few northeastern and southern counties, the region that was driest in the preceding month received the heaviest rains in September. [illegible] rains occurred generally in the period 2d-4th, and 26d-28th. Local to nearly local showers, irregularly distributed, were reported in the period 8-16th, 14-16th, 19th, 21st, and 28-29th. Very little precipitation occurred in the 5th. The range for the State was between 1.15 inches at Stearns, McCreary County, and 6.54 inches at Ford's Ferry, Crittenden County. Days with thunderstorms were: 1, 4, 5, 9, 13, 16, 22, 23, 27, 28.

MISCELLANEOUS.

Sept. 9.—Hail caused heavy damage to tobacco in the southern part of Carter County.

Breese. Very little run off resulted from the heavy rains. Pool stages prevailed in all streams during the month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. †Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
¶ Post-office addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Oneonta, California, Ky.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Daily Precipitation for September, 1936.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning: amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

§§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

*, etc., indicate respectively 1, 2, etc., days missing from record.

W. B. to Louisville, 16-26-36 Inc.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

Vol. XLI Louisville, Ky., October, 1926 No. 10

GENERAL SUMMARY.

Weather somewhat warmer than the seasonal average in the first three weeks favored the growth and ripening of late crops. Soil moisture and water for livestock continued deficient in many southern districts until the rains at the end of the first decade. After these rains seeding advanced more rapidly in the southern counties, where grain previously sown came up to satisfactory stands. Fall grains in the northern counties grew vigorously and tended to rankness. Some early rye became available for pasture. Bluegrass pastures and other forage crops improved to such an extent as to greatly relieve feeding and almost provide complete grazing requirements. Except for slow growth in places near the southern border, due to moisture deficiency, normal autumn development of grains and pastures had been restored by the end of the month.

Abnormally cool weather in the last decade caused growth to diminish. Killing frosts that ended the growing season occurred quite generally on the 27th and 28th. The lateness of these frosts permitted fair sized potatoes to develop from plants that presented a hopeless appearance a month earlier. Although most potatoes did not completely mature, the warm weather and sunshine brought remarkable improvement for so brief a period of principal growth.

Practically all corn matured, even the latest plantings in the western bottoms. All tobacco of consequence was cut and housed in good time. The favorable moisture and temperature conditions greatly increased the late yield of tomatoes and prolonged the canning season. Large quantities of late vegetables were also grown. The frosts caused some damage by cutting short this late production in most districts, but the hardier vegetables continued to yield in southern sections until the end of the month.

In the effort to save all the feed available, corn gathering was pushed more rapidly than usual. In the favorable periods of sunshine and high temperatures haymaking from alfalfa and soybeans continued. Rather frequent showers and wet fields interfered considerably with corn gathering and haymaking, but led to an early beginning of tobacco stripping.

TEMPERATURE.

The temperature for the month averaged near normal, but varied decidedly. It was 5° to 10° above normal in the periods 5-9th, 13-16th, and 19th-22d, with maxima above 80° on a few days. In the short intervals between these warm spells, and also in the last decade, daily deficiencies were approximately the same. Minima fell below freezing at nearly all stations on the 27th and 28th. The extremes were 88° at Pikeville on the 8th and 9th, and 24° at Anchorage on the 27th.

PRECIPITATION.

Precipitation for the State averaged considerably above normal and was fairly well distributed. Amounts at most stations ranged between 3.0 and 4.0 inches. Limited areas in the west, central, and eastern divisions received from 4.0 to 5.0 inches. Stations in several north-central counties and near the south-central border reported from 2.5 to 3.0 inches. The range for the State was between 1.88 inches at Glasgow and 6.12 inches at Maysville. Moderate to heavy rainfall occurred in all districts in the periods 6-11th and 16-17th. Light to moderate rains were reported from central and western sections, and moderate to heavy rains from the western counties from the 25th to 27th. Scattered showers occurred on the 1st. Days with thunder storms were: 6, 7, 8, 9.

MISCELLANEOUS.

Rivers.---Although the soil became fairly well saturated toward the close of the month, there was little runoff. Flood stages were scarcely disturbed.

PRESSURE, WIND, HUMIDITY AND SUNSHINE.

All temperature data are taken from self-registering thermometer.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

† Also on other dates. ‡‡ Received too late to be included in means and summaries.

* Postoffice addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Omeata, California, Ky.

** Precipitation by U. S. Engineers.

VOL. XLI LOUISVILLE, KY., NOVEMBER, 1936 No. 11

GENERAL SUMMARY.

Although the month was colder than normal, abundant sunshine and short intervals of relative warmth maintained slow growth through the first three weeks. Grass and some rye pastures furnished considerable grazing early in this period, but frequent lapses to subnormal temperature reduced growth practically to dormancy by the end of the second decade. Temperatures far below the seasonal average in the last week stopped all growth and brought pastures and grain fields to winter condition. At the end of the month fall grains were somewhat undersized but generally in good condition.

Nearly all of the precipitation for the month occurred in the first four days. The heavy rains, and in central districts the remarkably heavy snowfall, caused some damage to shocked corn and complete cessation of the late potato harvest. Because they had not shed their foliage, shade and fruit trees were extensively broken and damaged by the weight of the wet snow, which in some places amounted to eight inches. As a result of soil saturation and standing water fields could not be entered during the first week, and not much outdoor work could be accomplished in the first decade. During this period tobacco stripping began on most farms. Continuously dry weather that followed the wet spell soon dried the soil sufficiently that corn gathering and potato digging could be resumed. Most potatoes had been dug by the middle of the month and corn was nearly all in crib by the end. Stored grain dried out more quickly and thoroughly than usual. Except for a few windy days and decidedly cold mornings, the weather of the first three weeks was generally comfortable for the usual farm activities.

As the dry weather continued and fall work was completed, many farmers began their winter plowing. Low humidity caused rather rapid loss of surface moisture, but this tendency was offset by low temperature late in the month. Moisture remained ample for the needs of grains. While favorable for most farm operations, the persistent dry weather brought an end to the stripping of tobacco rather early in the month. It interfered seriously with the preparations for marketing the crop that are usually made in the last two weeks of this month.

TEMPERATURE.

The first two days were decidedly warm, with maxima of 80° at some stations. After this temperatures somewhat below normal prevailed for a decade, followed by variable conditions until the end of the third week. Quite low temperatures occurred over the snow cover on the 4th and 5th. Unseasonable cold prevailed during the last decade, with minima ranging from 11° to 16° at many stations in the period 27-30th. The highest was 81° at Paducah on the 2d, and the lowest 10° at Greenville on the 29th.

PRECIPITATION.

Precipitation averaged near normal and was fairly well distributed over the State. Some western and northern districts received slightly more than 4.0 inches. In most of the State amounts ranged from 3.0 to 4.0 inches. Stations in a few central and northern counties reported from 2.0 to 3.0 inches. The range for the State was 1.82 inches at Pikeville and 5.62 inches at Henderson. Heavy precipitation, largely snow, occurred on the 4th and 5th. The total snowfall in this period ranged from 1.0 inch in the extreme southeastern counties to 8.5 inches in the northern part of the Purchase. This snow fell at about 32° and partly melted during its occurrence, hence the entire amount did not show in accumulated depths. A few portions of the State reported light rain on the 2d. Light and local precipitation occurred on the 1st, 8th, 11th, and 24-27th. Thunderstorms were reported on the 1st, 2d, and 3d.

MISCELLANEOUS.

Floods.—The heavy snow and rain on the 4th caused a rise that continued to moderate stages in the Ohio from the 5th to 12th. The river had subsided to low stage by the 22d.

State averages and extremes																				

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †Ransey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T. Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries

‡ Postoffice addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Oneonta, California, Ky.

** Precipitation by U. S. Engineers.

Daily Precipitation for November, 1936.

GENERAL SUMMARY.

The month was somewhat warmer than normal, but most of the temperature excess accumulated in the last week. Temperatures below freezing during the first three weeks caused winter grains to remain dormant. The mild weather later on started growth in pastures and grain fields. Rye pastures improved and were used to some extent.

The weather was favorable for outdoor work about half of the month. Corn gathering was completed on most farms without delay or loss of consequence from weather conditions. Fields moderately frozen most of the time were readily entered for removal of corn and fodder.

Heavy rains early in the month in the eastern and some southern counties caused considerable run-off, otherwise the precipitation of the first three weeks was quite well absorbed and largely carried into the subsoil. Winter plowing was possible during periods of considerable length. It continued at a fair rate until the rains near the end rendered the soil too wet. On many farms most of the land that would usually be broken in the spring had been plowed by the beginning of the last rainy interval. While the rains were heavy enough in some places to pack the plowed land, in most of the State it remained in good condition and the broken surface aided the subsoil in taking up moisture. Four weeks of dry weather preceding these rains had prepared the soil for the reception of an unusual amount of water. The surface layers were soon freed from saturation, so that freezing caused little or no heaving of winter grains, even on clay lands. The condition of wheat, rye and barley remained generally good to excellent, with no appreciable injury apparent.

The showery weather in the first and last weeks furnished sufficient atmospheric moisture to condition burley tobacco for stripping and marketing. The four day period of rainy weather near the end, accompanied by extensive fog at times, offered the first good opportunity to handle dark tobacco. The weather during two weeks or more in the middle of the month was generally too dry for manipulating tobacco. Judicious bulking in the first period of dampness, followed by temperatures not far from the seasonal average, enabled growers of burley tobacco to make continuous progress in preparing the weed for market.

TEMPERATURE.

Variable temperature conditions prevailed in the first three weeks, but as a rule the daily averages were below normal. A few relatively mild days occurred near the middle of the month. In the last decade temperatures were moderate to high. The last week was unseasonably warm, with the daily excess ranging from 10° to 25°. The highest was 70° on the 29th at Cumberland, and the lowest 10° on the 13th at Mammoth Cave.

PRECIPITATION.

Precipitation averaged somewhat greater than normal, but some northern counties received considerably less than the seasonal amount. Stations in a few southern counties reported from 6.0 to 7.0 inches. Precipitation decreased northward to 3.0 inches or less in a group of counties along the Ohio River from Jefferson to Kenton. Most of the State received from 4.0 to 5.0 inches. The heaviest rains occurred on the 6th and 31st. The range was between 1.77 inches at Grant, Boone County, and 7.26 inches at Mammoth Cave. Light to moderate precipitation occurred in the periods 2-3d, 10-11th, and 18-30th. Moderate to heavy rains were reported generally in the periods 6-7th and 27th-31st. Snow, varying from a trace at many western stations to 5.0 inches in some eastern districts, occurred from the 18th to 20th. A few western stations reported thunderstorms on the 30th.

MISCELLANEOUS.

Rivers.---The heavy rains of the 6th caused a moderate rise in the Ohio and other streams of the State. Another moderate rise had started on the 31st. Stages near or at pool levels prevailed during most of the month.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

(‖) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. (‡) Precipitation included in the next following measurement.

² Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

⁴ Love Oak

Daily Temperatures for December, 1936.

VOL. XLI LOUISVILLE, KY., ANNUAL, 1936 No. 13

GENERAL SUMMARY.

The cold weather in the last decade of January and the first three weeks of February was similar to the the severe conditions that prevailed in January, 1918 and February, 1899. Fairly heavy snow cover protected winter grains in the eastern counties, but it was generally inadequate in western districts. Because of the light precipitation and comparative dryness of the surface soil, grains came through this period in fairly good condition. The abnormal warmth of March, with precipitation near the average in most of the State, produced early and rapid growth. The relatively dry soil, loosened by the deep winter freezes, absorbed the rainfall unusually well. Fruit buds that had not been killed by the earlier sub-zero temperatures opened rather generally, only to be killed by the frequent freezes of April. Cold, rainy weather in the first half of April delayed growth and spring work, but its effects were less important because of the unusual progress in March. Weather warmer than normal in May, with light rainfall, rapidly developed the grain crops. Late in the month the dry weather interfered with transplanting of tobacco and germination of corn. Toward the end the increasing distress of vegetation, despite the excellent State of cultivation, gave evidence of developing drought. This condition became intensified in June, which was the driest of record. Except for perfect ripening and harvest of grains, its effect on crops was to cause widespread damage and retardation of growth. Drought and extreme heat in the first half of July greatly increased the injury to crops, especially in the north half of the State. Good rains restored growing conditions in the southern counties and some central districts. Rains early in August reached the dry northern area, but drought and extremely high temperatures returned in the last half of the month. Precipitation varied so greatly in the northern and southern districts as to make the difference between almost complete crop failure and relatively good yields. Good rains early in September improved late crops, and other rainfall late in the month completed their growth. Favorable temperatures until late in October permitted fall crops and forage to mature. This weather was especially timely because of the shortage of vegetables and feed. The October rainfall was ample for fall grains, which continued slow growth until the middle of November and entered the winter in good condition. Dry weather that prevailed in November and December favored corn gathering, but interfered with stripping and marketing tobacco.

The Weather By Months.

JANUARY.---Mild weather in the first half favored the gathering of corn and handling of tobacco. Later on, in the period of severe cold, not much work of this character could be accomplished. With the exception of a week in February, 1899, the week ending with the 28th was the coldest on record at many northern stations.

FEBRUARY.---The dry cold of the first three weeks continued to interfere with marketing tobacco. Freezing to extraordinary depths caused much damage to water pipes and macadam roads. A reaction to abnormally high temperature in the last week started growth in fields and pastures.

MARCH.---During the first two weeks spring preparations for farming and gardening were scarcely interrupted. Most tobacco plantbeds were sown at this time. Wet weather in the last half seriously interfered with outdoor work.

APRIL.---The cold weather discouraged corn planting and retarded growth of tobacco plants. Sowing of oats, planting of potatoes, and most gardening were delayed from two to three weeks.

MAY.---Warm, dry weather favored planting and germination of delayed crops. Lack of rain in the last half prevented most tobacco transplanting in the hilly districts, and was unfavorable for obtaining a stand where plants were set by machine. Dry weather practically ended the strawberry season.

JUNE.---A wave of heat in the last few days set new temperature records for the month. Rainfall was not sufficient in any large area of the hilly districts to permit much tobacco transplanting. Plants died slowly as their water supply evaporated. Pastures failed generally by the middle of the month.

JULY.---Extensive damage to corn, pollen, and tassels to set ears, resulted from the high temperatures and drought in the first half. The rains were extremely local and irregular, causing marked contrasts in crop conditions. Drought continued unbroken in most northern counties.

AUGUST.---Tobacco improved decidedly after the early rains and considerable late corn developed. Pastures partly recovered in northern districts, but dried up again later in the month. Late potatoes and forage crops made very slow progress.

SEPTEMBER.---Late crops and pastures improved again in the south, but growth was checked by the return of extreme heat in the second decade. The late rains prepared the soil for fall seeding and restored pastures to good condition.

OCTOBER.---Delayed frosts especially in cured late potatoes, tomatoes, and late gardens. Soil and weather conditions were highly favorable for fall seeding and ensuring germination. Abnormally cool weather in the last decade delayed growth.

NOVEMBER.---The remarkably heavy snowfall in central districts caused much damage to shade and fruit trees, which had not shed their foliage. Corn in shock was also damaged by the snow and heavy rains of the first week. Grass and the pastures furnished good grazing in the first half.

DECEMBER.---While relatively cold, the prevailing dryness of the month enabled farmers to finish corn gathering. Winter grains remained in good condition.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, current records for which are used in determining the normal precipitation. The departures for stations having less than ten years of record are based on comparison with records at adjacent stations having long records. For each station or division the departure from normal is shown for each month and for the year. A minus sign (-) before a departure means deficiency in precipitation, and a plus sign (+) means excess. The normal precipitation for each station or division means the average precipitation for the period ending with the year 1930, or for the number of years the station has been in operation if less than thirty years.

*+12.04. **+22.33. Rumsey, Brownsville and Woodberry are locks on the Green River and Greenup is on the Kentucky River.

All temperature data are taken from self registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

*Compared with 45 years' normal.

NOTE. Tables and charts giving climatic data for Kentucky in detail during 1935 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in Charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1909.
